In the next year the United States, represented by William W. Rockhill—one of the best-trained men ever sent to China by the United States Department of State—participated in the peace negotiations which followed the Boxer outbreak. Rockhill, always striving for clemency, succeeded in whittling down the punitive measures for which others strove (even so, they were excessive), and in preserving the imperial government for a few more years. One important byproduct was that in 1908 and again in 1924 the United States government, acting on the suggestion of Dr. Arthur H. Smith, a missionary, and following the precedent set in 1885, decided to return the undistributed part of the indemnity. The money was used by the Chinese for the education of their youth, many of whom were sent to the United States for advanced study. This enlightened step was generally followed later by the other governments concerned, though different uses were made of their funds.

After the establishment in 1912 of the Chinese Republic which the United States recognized in 1913, the United States government looked sympathetically on the republic's efforts toward reconstruction. As soon as the United States was assured of the genuineness of Japan's Twenty-one Demands (1915), it joined with Great Britain in protests to Japan, a move which resulted in the withdrawal of the most objectionable demands. At the peace conference in Paris in 1919, President Woodrow Wilson sympathized with China's demand that Japan be prevented from continuing its hold on the former German possessions in Shantung, but gave in to Japan's insistence in the face of Japan's support by the other powers, and his far greater desire to see his creation, the League of Nations, brought into being. Later, at the Washington Conference of 1921-1922, this was corrected, and the Nine-Power Treaty drawn up at that time bound its signatories to respect the sovereignty and independence and the territorial and administrative integrity of China, and to support the principle of the Open Door in China.

For a decade it looked as if China had been well started on the road to health and strength, without interference from its neighbors. There was a burst of interest, in the United States and elsewhere, in the upbuilding of its commerce, communications, currency, law codes, opium suppression, sanitation, education, and the like, in which both the United States government and private individuals, companies, and institutions (notably missionary bodies and the Rockefeller Foundation) took part. That decade ended suddenly on Sept. 18, 1931 with Japan's invasion of Manchuria. Secretary of State Henry L. Stimson proposed to the League of Nations that it apply sanctions against Japan, and promised American support. The Council of the League was unwilling, however. Whereupon, Stimson proclaimed in identical notes to China and Japan that the United States refused to recognize any situation or agreement which was contrary to its own announced policy of the Open Door, and which impaired the provisions of the Nine-Power Treaty. This had no effect on the ruling group in Japan, which continued its program of territorial aggrandizement as it saw fit. Until 1941 the United States government endeavored to be as correct as possible in its dealings with Japan, in the face of a rising tide of resentment among American citizens against the acts of the Japanese military on the continent. These relations came to an end on Dec. 7, 1941 with the outbreak of war. To the end of hostilities the United States was an active ally of China. In 1946, with American soldiers and marines largely withdrawn from the China theater, United States Ambassador Gen. George C. Marshall, and many others, both civilian and military, were seeking to be of assistance in hastening China's recovery.

Their efforts proved fruitless, however, and General Marshall left Nanking early in 1947 convinced that the Nationalists and Communists were making no genuine efforts at rapprochement. During the shooting war which developed, the Nationalists, largely supplied with United States equipment and officered by some United States-trained men, gained initial successes. By the end of 1948, however, demoralization set in; much of the equipment passed into the hands of the enemy; and all resistance on the continent faded in the winter of 1949. The Nationalists in their redoubt on Formosa hoped for more direct American aid, but this was denied them until, in June 1950, the United States ordered the Seventh Fleet to patrol Formosa Strait, stationed an air force unit on the island, and subsequently appointed a military and naval attaché and sent an army commission to Formosa to survey Nationalist China's most pressing defense needs. The United States government also strengthened its diplomatic ties with the Nationalists by directing (July 28) a minister to head its legation on the island. Meanwhile, it continued the Economic Cooperation Administration (ECA) program of economic assistance to Formosa, and in May provided additional funds for scholarship aid to Chinese students and scholars in the United States. The possibility that the People's Republic of China would be recognized instead was made improbable early in 1950, when the Communists mistreated United States consular and military officers and confiscated part of the one-time embassy compound in Peking; it was made out of the question when, in November, the Communist Chinese Army attacked United Na-

tions forces in Korea, and the chief of the Communist delegation to the United Nations, invited to argue their case with respect to Formosa, launched into bitter diatribes against the United States government and made impossible demands upon it. The United States consequently had no official representatives on the Chinese mainland, but a dwindling number of American citizens continued their educational, medical, and evangelistic activities.

L. CARRINGTON GOODRICH,
Professor of Chinese, Columbia University.

CHINABERRY or **WILD CHINA TREE**, a common name for the soapberry tree (*Sapindus marginatus*). It is a handsome tree, sometimes growing as high as 60 feet. The flowers are white, and the oval berries are very saponaceous. It grows from Florida westward to Arizona and northern Mexico, and in southern Kansas. The wood is very hard and heavy, weighing nearly 60 pounds to the cubic foot. The name chinaberry is also given to the China tree, *Melia azedarach*, a native tree of India, also called pride of India. It is extensively cultivated in warm countries as a shade tree.

CHINANDEGA, chē-nān-dā'gā, Nicaragua, capital of the department of the same name, situated 26 miles northwest of León, and 13 miles from the port of Corinto on the Pacific Ocean, with which and with Managua it is connected by rail. It is the center of trade for the surrounding rich agricultural area, and it has a large sugar refinery. Pop. (est. 1943) 15,525.

CHINCH BUG (*Blissus leucopterus*), the popular name of a fetid insect of the family Lygaeidae, resembling the bedbug. It is very destructive to wheat, corn, and other crops of the southern and western parts of the United States. The name is also applied to the bedbug (*Cimex lectularius*).

CHINCHA, chēn'chā, **ISLANDS**, a group of small islands off the coast of Peru, situated at latitude 13°38'S. and longitude 76°28'W. They are granitic, arid, and destitute of vegetation, and their coasts are difficult of access. They formerly contained large deposits of guano.

CHINCHILLA, chīn-chīl'ā, a genus of South American herbivorous rodents (*Chinchilla laniger*) allied to the cavies, which they resemble in the general shape of the body, in the length of

the hind legs, in the conformation of the rootless molars, and in the nature of the fur, which is rather woolly than silky. The chinchilla is about 10 inches long, with a tail of equal length, and is covered with a beautiful pearl gray fur of high commercial value. It lives gregariously in the Andes of Peru, Bolivia, and Chile, and makes numerous and deep burrows. It is gentle and playful and loses none of its liveliness in captivity. In the United States chinchillas are raised commercially. The genus gives its name to the family Chinchillidae, which contains two other genera: *Lagidium chinchilla*, a large chinchilla-like rodent of the Andes; and the viscacha (*Lagostomus maximus*), a burrower found in large numbers in the Argentine pampas. The chinchilla derives its name from the Quechua word *sinchi* (strong).

CHINCHON, chên-chôn', CONDE DE. See CARRERA BOBADILLA CERDA Y MENDOZA, LUIS GERÓNIMO FERNANDEZ DE.

CHINCHON, Spain, a town 25 miles southeast of Madrid. Peruvian bark was named chinchona (later changed to cinchona) after Condesa Ana de Chinchón, wife of the viceroy of Peru, in 1638.

CHINDE, chîn'dě, town, Mozambique, on the only navigable mouth of the Zambezi River. It was at one time the chief port for Northern Rhodesia and Nyasaland, but was superseded by Beira, which has good rail connections. Pop. (1940) 1,442.

CHINDWIN, chîn'dwîn', river in the Sagaing division of Upper Burma. The chief tributary of the Irrawaddy, it has a length of approximately 550 miles and is navigable for 350 miles. The largest town on the river is Monywa, which is connected by rail with Mandalay.

CHINESE ARROWROOT. See NÉLUMBO.

CHINESE BIRDS' NESTS. See BIRDS, NESTS OF.

CHINESE CHIPPENDALE. See CHIPENDALE FURNITURE.

CHINESE GORDON. See GORDON, CHARLES GEORGE.

CHINESE HEMP. See CORCHORUS.

CHINESE LACQUERWORK. See LACQUERS AND LACQUERWORK.

CHINESE LANTERN, a collapsible lantern made of thin paper, usually patterned in various colors, and used for decorative (both door and outdoor) illumination.

CHINESE TURKESTAN or **CHINESE ATARY**. See SINKIANG.

CHINESE WAX. See WAX.

CHINESE WHITE, a pigment prepared from the white oxide of zinc (ZnO), introduced into the arts in the late 18th century as a substitute for preparations of white lead. Its color is changed by exposure to air. Though not so

heavy in body as white lead, when mixed with water colors, it renders them less transparent.

CH'ING, ch'ing (MANCHU), the last Chinese imperial dynasty, succeeding the Ming in 1644 A.D., and ending in 1912 with the establishment of the republic. Peking, captured by Chinese-Manchu forces from a rebel army in 1644, displaced Mukden (Shenyang) as the chief Manchu administrative center.

CHINGFORD, ch'ing'fêrd, England, municipal borough in Essex, situated 12 miles northeast of London and just southwest of Epping Forest. It is part of Greater London. Pop. (1951) 48,330.

CHINGHAI, ch'ing'hi', or **KOKO NOR** (Blue Sea), second in size of China's provinces, has an area of about 257,655 square miles. Formerly part of Nearer Tibet, it became a province in 1928. It is named after Koko Nor, the largest of the Chinese salt lakes, which is situated in the northeastern part of the province. This lake, over 65 miles long and almost 40 miles wide, is fed by 72 rivers, large and small. The headwaters of China's two largest rivers, the Yangtze and the Hwang Ho (Yellow River), are in Chinghai. Branches of the Kunlun Shan cross the province, which is on a plateau. Chinghai is known for its magnificent scenery and for the colorful Lamaist temples which accentuate its landscape. Agriculture is very limited, and animal husbandry is the main source of livelihood. In addition to rich deposits of gold and coal, Chinghai has some iron. The gold is mined by the primitive method of panning. To develop the province, the national government built a small power plant in Sining, the capital. There are no railroads, but there is a road system of more than 1,000 miles, constructed during the Sino-Japanese War of 1937-1945. Pop. est. 1,200,000.

CHINGLEPUT, ch'ing'g'l-pōōt, town, India, in Madras Province, 36 miles southwest of the city of Madras, situated in a valley surrounded by hills. It has Roman Catholic and Protestant missions, a hospital, and the ruins of a fortress captured by the British in 1752. Pop. (1941) 17,829.

CHINHAI, chîn'hi', city, China, in Chekiang Province, about 12 miles from Ninghsien (Ningpo), on Hangchow Bay. It did not become a treaty port and developed no foreign commerce of its own; instead, it serves as a transshipment point for trade with the Chu Shan Archipelago. Pop. (est. 1948) 13,987.

CHINHSIEN, jîn'shyên' (CHINCHOW), city, China, in Liaoning Province, Manchuria, connected by rail with Tientsin and Mukden (Shenyang). It is an active trading center and has a population (est. 1942) of 142,606.

CHINIOT, chîn'i-ût, town, Pakistan, in the Punjab, 80 miles west of Lahore. It is known for its wood carving and has manufactures of coarse cloth. It has a considerable trade in wheat, cotton, and other agricultural products. Pop. (1941) 34,437.

CHINKIANG, chîn'kyäng', city, China, in Kiangsu Province. The city is on the Yangtze

River at its junction with the Grand Canal, 40 miles east of Nanking. The city is situated on a plain with hills rising in the distance on three sides. Its name means "guard the river," an indication of its military importance for many centuries. The history of Chinkiang goes back about 2,000 years. In the 5th century A.D. important irrigation works and canal building were undertaken in this area to improve agricultural production and increase trade. Marco Polo tells of the town and of the establishment of Nestorian Christian churches there, a fact confirmed by a Chinese record of about 1333.

In 1842, during the Opium War, it was taken by a British fleet after determined resistance by the Manchu garrison. Later the Taiping rebels seized and held it from 1853 to 1857, leaving the city a ruin. The city, together with its river port, was officially opened to foreign trade by the Treaty of Tientsin (1858), and after its rebuilding, business grew for a time. Construction early in the 20th century of the Shanghai-Nanking and Tientsin-Pukow railways diminished its importance, particularly in respect to foreign trade. But Chinkiang flourished anew when (1928-1949) it succeeded Nanking as capital of Kiangsu Province. It was separated from Tantu County in 1949 to become an independent municipality. Pop. (1948) 179,059.

CHINLING SHAN or **TSINLING MOUNTAINS**, chin'ling'shān', China, a range running east and west, chiefly in central Shensi Province. It is part of the mountain barrier dividing the agricultural regions of northern and southern China. Its highest peak rises to about 12,000 feet.

CHINNERETH, Sea of. See **GALILEE**, SEA OF.

CHINO, chē'nō, city, California, in San Bernardino County, about 30 miles east of Los Angeles, on the Southern Pacific railroad. It is situated at an altitude of 730 feet. Chino is the center of a rich agricultural area, producing citrus and other fruits, walnuts, potatoes, beans, sugar beets, grain, and dairy products. Thoroughbred horses, cattle, sheep, and hogs are raised in the vicinity, and there is a state game bird farm nearby. The city is the site of the Casa Colina Home for Crippled Children and the California Institution for Men, a state honor prison. There is a modern community building. The Chino Unified School District serves both the city and its trading area. Founded in 1887, the city was incorporated in 1910. It is governed by a mayor and council. Pop. (1950) 5,784.

CHINON, shē-nōn', town, France, in the Department of Indre-et-Loire, situated on the Vienne River, 18 miles east-southeast of Saumur. Crowning a lofty rock are the ruins of an old castle which once belonged to the Plantagenets; here Henry II of England died in 1189. It was later the residence of several French sovereigns, and here, in 1429, Joan of Arc revealed her mission to Charles VII. A farmhouse across the Vienne in La Devinière is pointed out as the birthplace of François Rabelais. Pop. (1946) 4,312.

CHINOOK, shī-nōōk' (from *Tsinúk*, the Chehalis Indian name for this tribe), the most

important and best-known tribe of the Chinookan linguistic family of North American Indians. They were first described by Meriwether Lewis and William Clark in 1805. At that time the Chinook numbered about 400, living in several small villages on the north side of the Columbia River from its mouth to Grays Bay and north along the Pacific coast to the northern shore of Willapa Bay in the present state of Washington. Their houses were large plank structures, each occupied by three or more families. They lived primarily upon fish, wild roots, and berries. Commonly traveling by water in large dugout canoes they made extensive trading journeys. Their language formed the principal basis for the Chinook Jargon, a trade language employed by both Indians and whites along the Pacific slope from California to Alaska. The custom of artificially flattening the skulls of infants by frontooccipital pressure was common among them; hence they were often referred to as Flatheads. In the mid-19th century the Chinook proper became mixed with the Salishan-speaking Chehalis and lost their tribal identity.

Many small tribes speaking languages closely related to that of the Chinook proper lived on the lower Columbia River west of The Dalles at the beginning of the 19th century, and collectively comprised the Chinookan linguistic family. Lewis and Clark estimated the total population of these tribes at 16,000 in 1805. In 1829 an epidemic destroyed four fifths of the Indians in this region. The survivors continued to decrease in numbers and merged with tribes speaking other languages. Chinookan linguistic family is now represented by the remnants of a few tribes living on the Warm Springs Reservation in Oregon, on the Quinault Reservation in Washington, and scattered through their former habitat along the lower Columbia River.

JOHN C. EWERS,
Division of Ethnology, United States National Museum.

CHINOOK SALMON or **QUINNAT SALMON**. See **SALMON**—*Pacific Salmon*.

CHINOOK WIND, the name of two winds of the northwestern United States. The first is a warm, moist, southwest wind which occurs along the coasts of Oregon and Washington. The second is a warm, dry wind which blows from the Rocky Mountains over the plains that stretch from their eastern base. The moisture-laden winds from the Pacific Ocean striking the lofty barriers of the Cascades and the Rockies are forced to precipitate their moisture as rain and snow. When the ranges are crossed, the winds are cold and dry. Descending the eastern slopes of the mountains, they become warmer because the air is condensed, the atmospheric pressure at the base of the mountains being much greater than at the summit. The winds are still dry, however, since all their moisture was precipitated in crossing the mountains. In the descent of 10,000 feet or so to the plains of Montana and the Prairie Provinces of Canada, the winds have come so warmed by the increased pressure that they give a mild climate to regions far north. It is because of these winds that cattle on the prairies of Alberta can graze in the fields all winter, a snowfall of a foot or more disappearing in a few hours before the warm, dry breath of the Chinook. Not all the warm winds of Mo

tana and the regions north and south have their origin west of the Rockies. Various causes contribute to the formation of descending air, and when the descent is a number of thousands of feet, the winds resulting are always warm. Such winds blow over prairie regions west of the Missouri, but not always adjacent to the Rockies. Similar warm winds are known in other parts of the world, as in Switzerland, where they are called foehn winds.

CHINQUAPIN. See CHESTNUT.

CHINS, a tribe of eastern Bengal, Assam, and Burma. See KUKI-CHINS.

CHINTZ, chints (Hindu *chint*, spotted, variegated), a cotton cloth printed with gay designs of flowers and other patterns, usually in several colors. The name was originally applied to a stained or painted cloth made in India. The chintzes of the Coromandel Coast of India were celebrated in the time of Marco Polo, in the 13th century. They are mentioned also by Duarte Barbosa, a Portuguese who visited India soon after Vasco da Gama rounded the Cape of Good Hope in 1497. They were a favorite in the time of Queen Anne of England, early in the 18th century, long before cotton prints became inexpensive. Chintzes are made in many popular priced varieties and are extensively used in home decoration, particularly for curtains, drapes, and slip covers.

CHINWANGTAO or **CH'IN-HUANG-TAO**, chin'hwäng'dou', city, China, in northeast Honch Province near the Great Wall, on the Gulf of Po Hai. On the Tientsin-Mukden Railroad, it is a major commercial port, being ice-free during the winter. Opened in 1901 as a treaty port, it ships coal from Kaiping, in the Kailan mining district, besides glass, cement, and peanuts. After World War II, the United States Navy and Marine Corps maintained a base and airport there until the civil war of 1947 caused the evacuation of all American forces. Pop. (1947 est.) 100,000.

CHIOCOCCA, kī-ō-kōk'ā, a genus of four or five species of tropical plants in Central America and South America of the madder family Rubiaceae with opposite leaves, clusters of yellowish flowers, and two-seeded, white berries. One species, *C. alba*, has been used in Brazil and to some extent in Europe as a remedy for dropsy, snake bite, and other afflictions.

CHIOGGIA, kyōd'jā, city and commune, northern Italy, in the Province of Venezia, 15 miles south of Venice, at the southern end of the Venetian lagoon. It is situated on an island cut by three parallel canals, and is connected with the mainland by an 800-foot stone bridge; the harbor, one of the great fishing ports of Italy, was improved in 1935. One fourth of the population lives on fishing. Truck farming has become important on nearby reclaimed areas. There are shipyards and manufactures of soap, cement, sails, and lace. The city's atmosphere, with the old houses built on the canals, is strongly reminiscent of Venice. The cathedral, rebuilt by Baldassare Longhena in 1633-1674, and other old churches, have paintings of the Venetian school. Chioggia's city plan is probably of Roman origin. In the 8th century the town came under Venice and shared its history for centuries. The last

phase of the wars between Genoa and Venice for supremacy in the Mediterranean is called the War of Chioggia (1378-1380), because the decisive episode of the surrender of the Genoese fleet took place in the lagoon around Chioggia. Pop. commune (1951) 49,238.

CHIOS, kī'ōs, or **KHIOS**, kē'ōs (Turk. SAKIS-ADASI), island in the Aegean Sea belonging to Greece, five miles off the west coast of Asia Minor, from which it is separated by a channel 5 to 15 miles wide. The island is about 30 miles long from north to south and from 8 to 15 miles wide; its area is 321 square miles. With two small nearby islands it forms a nome (administrative department) of the Aegean Islands division of Greece. The island is mountainous in the north, where Mount St. Elias rises to over 4,000 feet, and has a fertile plain in the southeast where wine, figs, olives and olive oil, silk cocoons, and citrus fruit are produced. The aromatic liqueur called mastic is a typical product of Chios. Sheep and goat raising, and tanning are also important. There are marble quarries, antimony mines, and sulphur springs. The climate is delightful and the island is noted for its scenic beauty. On the east coast Chios, the capital and chief town, has a busy harbor. In ancient times it was famous for its school of epic poets and for its sculptors. Few remains are left, but interesting ancient coins have been found. On the west coast is a rich monastery, Nea Moni, founded in the 11th century, with Byzantine mosaics of the same period.

Ancient Chios claimed the honor of being Homer's birthplace. It was colonized by the Ionians. In the 6th century B.C. the island submitted to the Persians under Cyrus and suffered severe reprisals after the failure of the Ionian revolt in 494 B.C. against Persian rule. In 478 B.C. Chios joined the Delian League and regained its independence; it remained an ally of Athens even after the end of the Peloponnesian Wars. Chios prospered under the Romans and Byzantines, especially in its wine trade. Later it passed to the Seljuk Turks, Venetians, and Genoese; after 1346 A.D. it was actually in the hands of a Genoese trading company, but retained its right to self-government. In 1566 it was conquered by the Turks and remained a part of the Ottoman Empire until the Balkan Wars of 1912-1913, when it was awarded to Greece. In the anti-Turkish rebellion of 1822 a massacre of Christians took place here. During World War II, British and Greek troops landed on Chios in October 1944. Pop. (1940), island 72,777; city 26,617.

CHIPMAN, Nathaniel, American jurist: b. Salisbury, Conn., Nov. 15, 1752; d. Tinmouth, Vt., Feb. 15, 1843. For part of the Revolutionary War he was an officer in the American Army. Admitted to the bar in 1779, he was a member of the legislature in 1784 and in 1787 was elected assistant justice of the Supreme Court of Vermont; in 1789 chief justice and one of the commissioners to adjust the differences between New York and Vermont. In 1791 he was a member of the convention called to decide whether Vermont should join the Union, and became a joint commissioner with Lewis R. Morris to attend Congress and negotiate for the admission of Vermont into the Union. In 1793 he published *Sketches of the Principles of Government and Reports and Dissertations*. Elected chief justice again in 1796, he was the principal reviser of the code of

statute laws for Vermont. From 1798 to 1804 he was a United States senator. Another term as chief justice followed in 1813, and in 1816 he became professor of law in Middlebury College. His brother, Daniel Chipman, wrote his biography, *Life of the Hon. Nathaniel Chipman* (1846).

CHIPMAN, Ward, Canadian jurist: b. St. John, New Brunswick, July 10, 1787; d. there, Nov. 26, 1851. He was the son of Ward Chipman (1754–1824), a Massachusetts Loyalist who went to New Brunswick after the American Revolution. In 1805 he graduated from Harvard and pursued a legal career. In 1820 he was elected to the House of Assembly and became speaker in 1823. He acted as crown agent (1824–1829) in determining the boundaries of Maine and Nova Scotia, became puisne judge of the supreme court and chief justice of New Brunswick in 1834. He sat in the Legislative Council (1824–1842), where he became president.

CHIPMUNK, chip'mŭnk, any of a number of small ground squirrels of the genera *Tamias* and *Eutamias*, with a slender furred tail nearly as long as the body, and a coat of reddish brown fur, striped with white on the back. Some 17 species are known, ranging across Eurasia from northeastern European Russia to the Pacific and across the entire North American continent in wooded regions. All but two species occur in western North America, the genus *Eutamias* being particularly well represented in California. The ground color and the pattern of stripes are extremely variable, according to species and habitat. They are often seen running from stone to stone or along the ground, stopping now and then to sit erect, darting sharp glances at moving objects. The home is a tunnellike burrow, sometimes 20 feet long and always deep enough to reach below the frost line. It is enlarged into chambers at intervals, one of which, supplied with dried leaves and grass, is the sleeping apartment, the others, storehouses. In them the chipmunk stores his winter supplies of acorns and other small nuts, which he carries home, often several at a time, in his distensible cheek pouches. Buds, insects, and other plant and animal food are also eaten.

The breeding season is in the spring and the young are usually from four to six in number. The chief enemies of chipmunks are snakes, hawks, cats, foxes, and weasels. Most of these are dangerous only in the open, as they are too large to disturb a chipmunk at home. A weasel, however, can attack him in his burrow and to avoid him the chipmunk makes an opening for possible escape at the far end of the burrow.

Consult Seton, Ernest Thompson, *Lives of Game Animals*, vol. 4 (New York 1928); Howell, A. H., *Revision of American Chipmunks (genus Tamias and Eutamias)*, with bibliography, Biographical Survey Bureau, North American Fauna 52 (Washington, D.C., 1929); Johnson, D. H., "Systematic Review of the Chipmunks (genus Eutamias) of California," *Publications in Zoology, University of California*, vol. 48, no. 2 (Berkeley, Calif., 1943).

KARL KOOPMAN.

CHIPPAWA, chip'ă-wă, village, Province of Ontario, Canada, in Welland County, situated on the Niagara River at the junction of Welland River (formerly Chippawa Creek) about 2½ miles above Niagara Falls. The name is a popular adaptation of "Ojibway," a numerous and widely distributed tribe of Algonquian Indians (see

CHIPPEWA). The first settler in the vicinity was Thomas Cummings in 1783; the village was founded by United Empire Loyalists a year later. Chippawa is known to history from the battle in the vicinity between American and British forces during the War of 1812, described in the following article. Originally the upper landing place of the portage around the great cataract, the village now marks the intake for the large Queenston power plant of the Hydroelectric Power Commission of Ontario, six miles below the falls. A large manufactory of artificial abrasives is the only important local industry. Pop. (1951) 1,762.

CHIPPAWA, Battle of. An action of the War of 1812 between American and British forces which took place on July 5, 1814, resulting in a decisive American victory. The campaign of which it was an early incident, and which aimed at the recovery of the Niagara frontier and the occupation of the peninsula, was the most bitterly fought of the northern war on land. Under orders from Secretary of War John Armstrong, Maj. Gen. Jacob Jennings Brown, a resourceful and intrepid commander who had succeeded the vacillating James Wilkinson, had crossed the Niagara from Buffalo on July 3 and in a few hours had reduced Fort Erie stockade, taking prisoner its garrison of 170 regulars. Thence, with Winfield Scott, Eleazar Wheelock Ripley, and Peter Buell Porter as brigade commanders, and with a total force of 3,500, he advanced 14 miles down the river to Street's Creek (now Usher's Creek), a shallow stream 20 feet wide, behind which he halted for reconnaissance. Meanwhile Maj. Gen. Phineas Riall, the British commander at Fort George at the mouth of the Niagara, had hastened upriver to Chippawa where he collected a force of about 1,500 regulars belonging to the Royal Scots, Kings, the Hundredth, and the Hundred-and-Third regiments, with artillery and a few dragoons, and 600 militia and Indians. These he posted unassailably behind the Chippawa River, here crossed by a bridge into the village. On the open plain two miles long between Street's Creek and the Chippawa, with the Niagara on the east and wooded terrain on the west, the battle was fought.

It was opened by Brown sending Porter's militia detachment to protect a bridge under construction further up the Chippawa intended for an attack on Riall's flank. Porter, however, was in turn outflanked and driven back in confusion by Riall who, abandoning his position behind the Chippawa, now rashly seized the moment for an advance in order of battle upon the main American force. Inexperience in actual war and an underestimate of the quality of the superior American Army (which had been drilled to a new mobility and efficiency by Brown) must account for Riall's movement. No less impetuously Scott, under artillery fire, threw his brigade across the creek to meet it, deploying into line as he advanced, with Ripley in support, and extending to prevent an enfilade. The two lines met in a withering fire of musketry and artillery under which the British broke and fled over the Chippawa, leaving a third of their effectives in killed and wounded (511) on the field, the American losses (almost entirely in Scott's and Porter's brigades) being somewhat less than half. Two days later Riall retreated to Fort George. Brown following as far as Queenston but eventually falling back to Niagara Falls where the still bloodier Battle of Lund-

Lane (q.v.) was fought on July 25. Later Fort Erie was abandoned and blown up. The Chippawa victory remains primarily a tribute to improved American generalship and morale over the earlier phases of the land war. "Small as the affair was," says Henry Adams, "and unimportant in military results, it gave the United States Army a character and pride it had never before possessed."

CHIPPENDALE, chip'en-däl, Thomas, English cabinetmaker: b. Otley, Yorkshire, England, 1718?; d. London, November 1779 (buried November 13). The most famous of English makers of furniture, his name is still used to denote a style. For many years little was known about this master other than his book, *The Gentleman and Cabinet-Maker's Director*, published in London on March 23, 1754. A second edition appeared in 1759 and a third in 1762, and the number of full-page plates was increased from 161 to 200. Additional documented facts are now known about his life.

He was a Yorkshire man, baptized at Otley on June 5, 1718. His father, John Chippendale, was a maker of joined furniture. About 1727 father and son migrated to London, where the elder worked as a journeyman and the son served his apprenticeship. In 1748, Thomas Chippendale married Catherine Redshaw and the following year opened his own cabinetmaking shop in Conduit Lane, Long Acre, at that time the center of furniture making in London. He remained at that address until 1753, when he moved to 60 St. Martin's Lane. His establishment there was presumably more of a display place than a workshop; it was a meeting place where London fashionables exchanged the gossip of the day and incidentally saw some of the new pieces of furniture designed by Chippendale and executed by his journeymen. Josiah Wedgwood and his London partner, Thomas Bentley, for a time displayed their china there and several artists had studios in the building.

About the year the *Director* was published, James Rannie became Chippendale's partner. Despite a fire in the workshop in 1755, the firm's business and prestige continued to grow. In 1760, on the nomination of Sir Thomas Robinson, an amateur architect of importance and former governor of Barbados, Chippendale was elected to the Society of Arts. Its membership at that time included many men famous in art or science—Robert Adam, the architect; John Julius Angerstein, whose paintings were the nucleus of the National Gallery; David Garrick, Oliver Goldsmith, Edward Gibbon, William Hogarth, Dr. Samuel Johnson, James Boswell, and Benjamin Franklin—besides a number of peers including the dukes of Devonshire, Portland, Richmond, the earl of Sandwich, and the earl of Chesterfield.

Chippendale made furniture for a number of the leading country mansions. Among them were Nostell Priory in Yorkshire, where several pieces and the bills for them are still preserved; Stourhead House in Wiltshire, and Rowton Castle in Shropshire. From 1765 to 1771 he designed and made a considerable amount of furniture for Harewood House, seat of the earl of Harewood near Leeds in Yorkshire. Dating about this time also is a bookcase made for the earl of Chesterfield. This sold for 1,800 guineas when the contents of Holm Lacy were dispersed in 1937.

In 1766 Rannie died and from March 2d to

24th there was a liquidation sale of the cabinet lumber on hand. For four years Chippendale conducted his business alone, then took Thomas Haig into partnership; the firm's name became Chippendale, Haig & Company and continued until 1822, when Chippendale's son, Thomas II, retired from business. Catherine Chippendale died in 1772 and was buried at St. Martin-in-the-Fields. Four years later he married Elizabeth Davis. He apparently prospered, for in 1778 he was assessed £66 on the parish rating books, a tidy amount for that period. He died in November 1779 and was buried in a vault in St. Martin-in-the-Fields. His age was recorded as 62. Of the eleven children who survived, Thomas II carried on his father's business in partnership with Haig. He was more of an artist than a cabinetmaker; several of his paintings were shown in the Royal Academy exhibitions of 1792 and 1798. See also CHIPPENDALE FURNITURE; FURNITURE.—English (Chippendale Period); FURNITURE, AMERICAN.

CHIPPENDALE FURNITURE. The period from about 1750 to 1775 is generally conceded to represent the golden age of English furniture design and craftsmanship. It bears the name of Thomas Chippendale (q.v.), most famous of all English cabinetmakers. He dominated the design and manufacture of fine furniture in London, and influenced the craftsmen of Dublin and the American colonies to such an extent that examples of their production are now known as Irish Chippendale and American Chippendale.

Chief characteristics of the Chippendale school of furniture are structural soundness and solidity, made graceful by use of flowing lines and well-executed carved details. In scale the pieces are ample enough for comfort and, structurally, they are well adapted to the purposes for which they were made. Details include bold cabriole legs terminating in claw-and-ball feet, straight molded legs, plain, fluted, or reeded on the outer sides, sometimes ending in the square Marlborough foot; pierced and carved back splats for chairs; serpentine or bowed fronts for chests of drawers and other case pieces; and broken pediment tops surmounting such tall pieces as secretaries and, in America, highboys and chests-on-chests. Carved ornamentation is done in such motifs as shell, scroll, foliage, and gadroon or Chinese frets. Mahogany was used almost to the exclusion of other woods, save in the American colonies, where some pieces were made of walnut by Philadelphia craftsmen, and of cherry by those of New England. In general line and proportion the Chippendale style was developed from the Early Georgian which, in turn, was derived from the furniture of the Low Countries with its inherent stiff heaviness. This was replaced by more graceful curves and flowing lines in the early Chippendale. As this style developed, almost simultaneously its breadth and scope were enhanced by elaborate adaptations from furniture of the Louis XV period, known as French manner Chippendale; the Chinese Chippendale in which details were adapted from ornamentation and architecture of the Celestial Empire, and the Gothic Chippendale wherein lines and details reflected Gothic architecture.

Furniture of the Chippendale period, as made in his own shop and by his London contemporaries, has been studied by antiquarians and students of design for more than half a century. Great interest attaches to Chippendale's *The Gentleman and Cabinet-Maker's Director*, first published in

London in 1754. The copperplate engraved illustrations in the *Director* were all in the nature of fashion plates and were not intended to be actual working drawings. With most of the pieces depicted, at least two different decorative treatments are shown, such as a side chair with one front leg cabriole shaped and carved, the other square and fretted, and the seat rail half plain and half fretted. Many of the chairs are shown with an arm at the right and none at the left, thus serving to depict it as either an armchair or a side chair. Some of the French commode tables show two variations for the same piece, one with full-width drawers and the other with a pair of hinged doors concealing the drawers contained within. With one of the designs for a chest-on-chest, four decorative treatments are shown and most of the plates for pedestal desks show at least two. The three editions of the *Director* present designs for 162 pieces of furniture; 41 for decorative accessories, such as girandoles, hanging shelves, and brackets, and 42 for details, such as cornices, fretwork, and shields for pediments. To one piece, a breakfast table with narrow drop leaves which Chippendale made for the earl of Pembroke, he gave the name of his client. As a result "Pembroke" became the standard designation for this type of table during the furniture periods that followed, and still continues to be used.

In the *Director*, Chippendale presented ideas for furniture design that had not previously reached beyond fashionable London. A considerable number of provincial cabinetmakers subscribed to the book, and thus his genius as a designer was followed by many working outside the London area. His followers and imitators were numerous in England, Ireland, and the American colonies. There, especially with the cabinetmakers of Philadelphia and some of the master craftsmen of New England, Chippendale designs were skillfully adapted to local tastes, and some of the finest American furniture resulted. A high point with these were distinctive highboys and lowboys and cabriole-leg chairs with pierced back splats that came from shops of such Philadelphia craftsmen as William Savery and Benjamin Randolph. Among the four styles of Chippendale furniture, outstanding designs are those typified by French commode tables, china cabinets, and elaborate canopy beds in the Chinese manner, and the Gothic breakfront bookcases and sideboard tables. See also FURNITURE—English; FURNITURE, AMERICAN.

P., *Chippendale and His School* (London and New York 1925); Cescinsky, Herbert, and Hunter, George Leland, *English and American Furniture* (New York 1930); Bond, Harold Lewis, *An Encyclopedia of Antiques* (Boston 1937); Honey, W. B., and Turner, W. J., *British Craftsmanship* (London 1948).

THOMAS H. ORMSBEE.

CHIPPENHAM, chip'en-ām, municipal borough, England, in Wiltshire, on the left bank of the Avon River, 12 miles east-northeast of Bath on the Great Western Railroad. Its name, derived from the Saxon *cyppan*, to buy, indicates its early existence as a market town. Listed in Domesday Book (1085) as a crown manor, its records go still further back to the 9th century and the Danish invasion. An ancient stone bridge of 22 arches, a 15th century parish church, and an old town hall are among its surviving points of interest. It is in a dairying region, manufactures

agricultural machinery, processes cheese, and cures bacon. Incorporated in 1553. Pop. (1951) 11,850.

CHIPPEWA, chip'ë-wā (a popular adaptation of the word "Ojibwa," meaning "gathering," referring to a style of moccasin which was gathered over the toe area), the largest Algonquian-speaking division, and one of the largest tribes of North American Indians. Their territory, at its largest extent, included much of the region from the Niagara River westward to Turtle Mountains, N. Dak., and from Wisconsin and Michigan northward about halfway to Hudson Bay. When first met by French traders and missionaries in the mid-17th century, they lived in the vicinity of Lakes Huron and Superior, their largest number residing near Sault Ste. Marie. Their population at that time has been estimated at 35,000.

The Chippewa were traditionally a woodland people who lived in scattered, loosely knit bands or villages in the forests bordering lakes and streams. Although they raised small gardens of corn, beans, squash, and pumpkins, they depended primarily upon hunting, fishing, and collecting of wild plant foods for subsistence. In the fall they gathered quantities of wild rice growing in the still waters of lakes and ponds. In early spring they made maple sugar. Their homes were built of pole foundations covered with birch-bark or rush matting. Their clothing of buckskin was decorated with porcupine quillwork. (In more recent times Chippewa craftsmen have employed elaborate floral designs in beadwork.) They constructed light birch-bark canoes and performed much of their travel by water routes connected by portages. In their religious ceremony of the mide'wiwin, observed each spring and fall, the sacred songs were recorded in the form of pictures incised upon birch-bark scrolls. They were effective orators and able storytellers. Chippewa stories provided much of the background for Henry Wadsworth Longfellow's well-known poem, *Hiawatha*.

About 1670 the Chippewa obtained firearms from white traders. In the next century they pushed westward, driving the Fox Indians from northern Wisconsin and forcing the Sioux south of the Minnesota River and across the Mississippi. After the Sioux obtained both firearms and horses, they were able to counter the aggressive thrusts of the pedestrian Chippewa with greater success. A group of the Chippewa moved out of the forests onto the grasslands west of the Red River of the North about 1800. They adopted many traits of Plains Indian culture and became known as the Plains Ojibwa.

The Chippewa ceded much of their land in the United States in a series of treaties and agreements, beginning as early as 1785. They now live on reservations within their former territory in Minnesota, Michigan, Wisconsin, and North Dakota, and in Ontario, Manitoba, and the Northwest Territories of Canada. Since the early days of French settlement the Chippewa have had a large admixture of white blood. Of a total Chippewa population in excess of 50,000 in 1950, probably fewer than 20 per cent were full-bloods.

JOHN C. EWERS,
United States National Museum.

CHIPPEWA FALLS, city, Wisconsin, lake resort, and Chippewa County seat; altitude 859 feet; on the Chippewa River near Lake Wissota; 10 miles northeast of Eau Claire; on the Chicago, Milwaukee, St. Paul and Pacific; Minneapolis, St. Paul & Sault Ste. Marie; and Chicago and North Western railroads. It is in an agricultural and dairying region, has creameries, canneries, and breweries. Other factory products are plastics, fishing lures, hydraulic pumps, shoes, woollens, corded yard, packed meats, mattresses, gloves, silos, doors and sashes, and other woodworking. The great hydroelectric plant of the Northern States Power Company is here; and the state headquarters of the Farmers Union; the state home for the feeble-minded; and a fine county courthouse. Tone Rock battlefield near the city was the scene of a Sioux-Ojibway conflict. Jonathan Carver, English explorer, visited the Indian village in 1766. A sawmill and dam were built here in 1836 by French-Canadians. The beautiful natural Irvine Park is located nearby. The Indians gave up their right to the Chippewa Valley in 1837 and Chippewa Falls soon became a lively lumber town. Pop. (1950) 11,088.

CHIPPING SPARROW, one of the most widely spread and familiar of North American sparrows (*Spizella passerina passerina*) of the linc family (Fringillidae), seen in summer by every roadside and in every garden of the United States east of the high plains and northward to Labrador and Great Slave Lake in the Northwest Territories of Canada. The "chippy" is of small size, has the streaked gray plumage of the sparrow, and is to be distinguished at a glance by its chestnut cap and plain white breast. It comes from the south in early spring and makes its home fearlessly near the house, forming a neat nest in some bush or vine, where its high-pitched trill—a monotonous *chippy, chippy, chippy*—is heard until late summer. The nest, made of grasses and fine twigs, is sometimes lined with horsehair; and this sparrow is often called hairbird. The five eggs are greenish blue, sparsely speckled with brown. It feeds its young, of which two broods are frequently raised, on aphids, small caterpillars, and other (usually injurious) insects; and at other times is a diligent eater of weed seeds. Both these services contribute to the beneficial effects of the chipping sparrow, and its home should not be harmed.

CHIPS FROM A GERMAN WORKSHOP, by (Friedrich) Max Müller (q.v.). This collection of special studies, incidental to the author's editing of a library of the *Sacred Books of the East*, appeared in four volumes (1867-1875).

CHIQUICHQUI PALM, *chē'kē-chē'kē*, either of two South American palms, the *Leopoldinia piassaba* or the *Attalea funifera*, yielding piassava fiber which is used in making ropes, mats, and brushes. It grows in swamps and along river banks. The coquilla nut is the fruit or nut of *Attalea funifera*. See also *ATTALEA*.

CHIQUIMULA, *chē-kē-mōō'lā*, city, Guate-

mala, Central America, capital of the department of the same name in the southeast of Guatemala, at an altitude of 1,378 feet, on the railroad to San Salvador. Chiquimula has valuable mineral deposits, raises cattle, and grows fruit, tobacco, sugarcane, wheat, and corn. Earthquakes greatly damaged the town in 1765 and 1773. The volcanoes Ipala and Quezaltepeque are nearby. Pop. (1950) city 8,848; department 112,275.

CHIQUINQUIRA, *chē-kēng-kē-rā'*, town, central Colombia, South America, in the Department of Boyacá, 75 miles north-northeast of Bogotá, Colombia's capital. At an altitude of 8,432 feet, it is on the Bogotá-Barbosa Railroad and is a market for sugarcane, coffee, corn, wheat, and potatoes, besides stock, cotton, and silk. Founded in 1586, the town each year attracts about 60,000 visitors to the shrine of Our Lady of Chiquinquirá in the lovely church built of local marble. Nearby are emerald mines. Its educational facilities include a state college, a private college of philosophy and letters, three colleges for women, and one higher school for men. Pop. (1938) 6,998.

CHIKITOS, *chē-kē'tōs*, a group of Indian tribes occupying the plains of the same name in eastern Bolivia. These Indians were agriculturalists and lived in fortified villages, which were politically autonomous. An undetermined number of them spoke languages of the Chiquitano stock. They were discovered in 1543 by the Alvar Núñez Cabeza de Vaca expedition which ascended the Paraguay River in search of the mythical El Dorado, and were conquered by another such expedition in 1557-1560. Released from Spanish rule when the city of Santa Cruz was moved westward in 1595, they reverted to their aboriginal mode of life. They suffered heavily from slave raids until the coming of Jesuit missionaries in 1691. The Jesuits grouped the Chiquitos into eight large and prosperous missions, but these were abandoned when the Jesuits were expelled in 1767, and the Indians slipped back into a half barbarous condition, in which they have remained. They have adopted many modern customs and were good agriculturalists and expert basket makers when studied in 1908. They still played the native rubber ball game and, during Christian feasts, danced with their faces hidden by cloth masks and their bodies covered with ostrich feathers. In 1766 the Jesuits calculated the population of Chiquitos at about 23,788; in 1831 it was 14,925. The present number of Chiquitos is not known.

IRVING ROUSE,
Professor of Anthropology, Yale University.

CHIRICO, *kē'rē-kō*, Georgio di, Italian painter: b. Volo (now Volos), Greece, July 10, 1888. Moving with his family to Athens, Chirico accomplished little at an art academy but preferred to roam about the classic ruins of the ancient city, forming his own ideas of art. After his father's death (1905), he went to Munich. There he was influenced by Friedrich Wilhelm Nietzsche to paint his dreams, and from 1908 his works were enigmatic. From 1908 to 1911 he lived in Italy, chiefly in Florence. He began working in Paris in 1911 and was one of the first surrealists. Two paintings on triangular canvases are examples of his originality: *The Serenity of the Scholar* and *The Enigma of Fatality* (both

1914). James Thrall Soby, author of *The Early Chirico* (1941), said, "His painting is hard to classify, since it is Italian but not Futuristic, Parisian but not Expressionist or Cubist, European but not traditional."

Chirico was also a stage designer and the author of *Hebdomeros* (1929). His paintings are to be seen in galleries in Rome, Moscow, Chicago, Buffalo, and New York.

CHIRIQUEI, chē-rê-kē', province, western Panama, on Pacific slope, adjoining Costa Rica. With an area of 3,693 square miles, it is served by railroads, motor launch, and highways, including the Inter-American Highway. It produces bananas, coffee, rice, corn, and sugarcane, much of which it exports to the United States, and is a center for lumbering and cattle raising. There is also manufacturing of shoes, soap, clothing, furniture, and other products, chiefly at David, the provincial capital. The Chiriquí volcano is within the province, through which flow the David, Chiriquí, and Chiriquí Viejo rivers. It was organized in 1850. Pop. (1950) 137,422.

CHIRIQUEI, village, Chiriquí Province, western Panama. On the Inter-American Highway, it is 7 miles east-southeast of David, capital of the province. It raises livestock and grows bananas, coffee, and cacao. Pop. (1940) 922.

CHIRIQUEI, isthmus, in the westernmost part of Panama, extending about 45 miles from the Pacific on the south, at Chiriquí Gulf, to the Caribbean on the north, at Chiriquí Lagoon. Bananas, coffee, rice, yucca, corn, and sugarcane are grown in this area.

CHIRIQUEI, river, western Panama, a non-navigable stream flowing southward for 45 miles from Cerro Horqueta, a peak of the Continental Divide, to the Pacific. It is joined by the Caldera River and empties into the same delta as the David River.

CHIRIQUEI, volcanic peak, long inactive, at the highest point of the Cordilleras in Panama, at an altitude of 11,067 feet. The range is sometimes known as the Sierra de Chiriquí, and the volcano as Barú. It is close to the Costa Rica border, just south of the Continental Divide, 28 miles from the manufacturing city of David.

CHIRIQUEI, Gulf of, an inlet of the Pacific Ocean at the extreme southwest part of Panama. Much of the commerce of David, major agricultural center in this section of the country, passes through Pedregal, its port on the gulf. Puerto Armuelles and Burica Peninsula form the western side of the gulf, which is 80 miles wide and 15 miles long. There are several islands in the bay, including Coiba, a penal colony.

CHIRIQUEI GRANDE, grăn'dà, village, Bocas del Toro Province, western Panama. This tiny port on the Caribbean Sea is situated about midway along the southern shore of Chiriquí Lagoon, 26 miles south-southeast of Bocas del Toro, capital of the province. Stock raising and lumbering are carried on near the village, and the port ships bananas, tobacco, rubber, coconuts, cacao, and abacá, the fiber for making Manila hemp. Pop. (1940) 64.

CHIRIQUEI LAGOON, an inlet of the Caribbean Sea in northwestern Panama, west of Mosquito Gulf. It lies between Valiente Peninsula on the east and Bocas del Toro Archipelago on the west. The lagoon provides a fine natural harbor for the movement of agricultural products out of the port of Chiriquí Grande.

CHIRIQUEI VIEJO RIVER, vyé'hô (Span. *viejo*, old), western Panama. Rising in the mountain range near Chiriquí volcano, it flows south for about 50 miles to the Pacific at Charco Azul Bay. In its lower reaches it is navigable to small vessels for about 6 miles.

CHIROGALE, kí'rô-gāl, or **MOUSE LEMUR**, any of three species of small lemurs of the genus *Cheirogaleus*, native exclusively to Madagascar. They live in trees and at the approach of the dry season curl up in a hollow place in a tree and sleep until the rainless time is over. Like hibernating animals of cold regions, they accumulate a large deposit of fat before becoming torpid, and when they awake have regained their normal condition. They feed chiefly on fruits and insects and build nests somewhat like a bird's. The dwarf lemur *Microcebus*, and the fork-marked lemur *Phaner*, also of Madagascar, are closely related and similar in most respects. See also **LEMURS**.

CHIROMANCY, kí'rô-măn-sî, the practice of attempting to foretell the future of a person by inspecting the lines of his hand, in the markings of which chiromancy professes to see a line of life and a line of fortune. In the general acceptance of the term, chiromancy, among students of the so-called art of palmistry, is restricted to the sense of foretelling the future by means of an examination of the palm of the hand, while chirosophy is applied to the interpretive science of the hand. It will be thus readily seen that the two terms have a tendency toward overlapping. As a science chiromancy or palmistry deals with the "seven mounts" of the hand, their lines and the interlacings of the latter. The names given to these mounts, Jupiter, Saturn, Apollo, Mercury, Venus, Mars, and the Moon at once connect the practice of chiromancy with the art of divination as carried on by means of a study of the stars. The mount of Jupiter is situated at the base of the first finger; that of Saturn, the middle finger; that of Apollo, the ring finger; that of Mercury, the little finger; that of the Moon, the wrist; that of Venus, the thumb; while that of Mars is beneath that of Mercury.

Chiromancy is a very ancient practice and seems to have been at one time in pretty general use among most of the peoples of Europe, of India, and of Egypt. It very probably had its origin in the ceremonies by the medicine men, diviners, and priests of very primitive times, to determine good and bad omens. The Assyrians, Hebrews, Chaldeans, Greeks, and Romans paid particular attention to the study of chiromancy. From a purely priestly institution it was degraded until it became a tool in the hands of unscrupulous fortunetellers who were often as ignorant and credulous as their dupes. But before it arrived at this latter stage, it had reached a position where it was looked upon as being as exact a science and as worthy of careful study as any of the sciences of the age. Men of the highest rank, position, intelligence and educa-

tion gave their time to its study. Already, in the early Middle Ages, it had begun to claim the attention of the studious and, a little later, the art was being practiced by a professional class, who took the place of the ejected pagan priests, and exploited the rich and poor alike. But all who practiced palmistry were not of this class; for there were many who undoubtedly believed in the art, which was taught in schools and colleges. However, in an age of extreme ignorance, the temptation to exploit a willing public became gradually greater; and chiromancy degenerated into palmistry and the latter into "fortune telling."

CHIRON, kī'rōn, in Greek mythology, the son of Kronos (Saturn) and Philyra. Kronos assumed the shape of a horse, in this amour, to deceive his wife Rhea.

The shape of Chiron, therefore, was half that of a man, half that of a horse. In point of fact, Chiron was one of the Centaurs. He was celebrated through all Greece for his wisdom and acquirements; and the great princes and heroes of the time were represented as his pupils. He was particularly skilled in surgery. When Hercules drove the Centaurs from Mount Pelion, they took refuge with Chiron in Malea; but their enemy pursued them even into this retreat and unfortunately the old teacher was wounded with a misdirected arrow. The speedy operation of the poison in which the arrow had been dipped rendered remedies useless; and Chiron suffered the severest torments. The gods, at his prayer, put an end to his life, though his nature was immortal by reason of his descent from Kronos. After his death he was placed among the stars and became the constellation Sagittarius.

CHIROPODY (PODIATRY), kī-rōp'ō-dī, (Gr. *cheir*, hand; and *pod*, foot). Defined as that specialty of the healing arts which is concerned with the care of the human foot in health and in disease. It consists of the prevention, diagnosis, and treatment of foot disorders by surgical, medical, electrical, and mechanical means, except the amputation of the toes or foot. Chiropody is a comparatively new medical specialty profession and until recent years was not well known by the general public. However, due to work performed by chiropodists in hospitals, government and state institutions, and the establishment of more private practices throughout the country, the profession has gained more prominence. That the services of chiropodists are appreciated by the medical profession is evidenced in the statement of the Judicial Council of the American Medical Association, "Chiropody is a practice ancillary—a hand maiden—to medical practice in a limited field. General opinion seems to be that chiropody fairly well satisfies a gap that the medical profession has failed to fill." Also, Elliott P. Joslin, M.D., of Harvard University has stated, "I think the work done by chiropodists, particularly for diabetic patients in hospitals, is invaluable—I heartily favor the association of chiropodists with doctors and surgeons in the hospitals of the country."

History.—Although chiropody was practiced in the sense of "giving the human foot special care" in the era of 372 B.C., it first came into recognition as a healing art when the guilds of barber-surgeons were popular in northern Europe during the 14th century. The term chiropody was first used to designate the science of foot care in 1785 when a practicing foot specialist in England published a treatise called *Chiropodologia* which dealt with the cause of painful and offensive cutaneous excrescences of the foot. In 1840 the first permanent chiropody office was es-

tablished in Boston, Mass., by Dr. Nehemiah Kenison.

Organization.—The National Association of Chiropodists was founded in 1895 and has affiliated state societies in every state in the United States. Its official publication is the *Journal of the National Association of Chiropodists*—founded in 1907. There are six specialty affiliated organizations—The American College of Chiropodists, The Fellows Podic Research Society, The American College of Foot Surgeons, The Fellows of the American Academy of Chiropodists, The American Society of Chiropodical Roentgenologists and The Military Association of Chiropodists.

Education.—In the United States there are six colleges of chiropody which have been approved by the Council on Education of the National Association of Chiropodists and are located in California, Ohio, Illinois, Pennsylvania, and New York. Entrance requirements and other data may be obtained from the executive secretary, National Association of Chiropodists, Washington, D.C.

Military.—Although chiropody received recognition from the armed forces during World War I, it was recognized as a qualified specialty organization in World War II. Eighty chiropodists served as commissioned naval officers. There were 2,900 chiropodists who served in various noncommissioned (navy and army) officer grades. A course in military chiropody was established at Temple University School of Chiropody (Philadelphia) in 1940. In 1944 chiropodists were admitted to membership in the Association of Military Surgeons of the United States. Former Surgeon General of the Navy, Ross T. McIntire, said "there is a place for these scientists in any health organization and these officers performed a commendable service which is essential to the health of personnel." Provision is being made for the commissioning of chiropodists in regular government health services including the Veterans Administration.

CLARENCE A. HIGGINS,
Member, Board of Directors, California Association of Chiropodists.

CHIROPRACTIC, kī-rō-prāk'tic (Greek *cheir*, hand; and *praktikos*, efficient). "A system of therapeutics based upon the theory that disease is caused by interference with nerve function. It is based upon the premise that all systems and physiologic processes of the human body are co-ordinated by the nerve system; that interference with the nerve control of these systems impairs their function and induces dysfunction or disease by rendering the body less resistant to infection or to other exciting causes. Its therapeutics is designed to restore normal function of the nerve system by scientific manipulation, specific adjustment, clinical nutrition and physiotherapeutic treatment of the structures of the human body, especially those of the spinal column."¹

Historical.—The principles upon which the science of chiropractic is based can be traced to the earliest physicians of antiquity. They were known and practiced by Hippocrates, the Father of Healing (460-370 B.C.), by Galen (130-200 A.D.) and other noted physicians of ancient Greece and Rome. Descriptions of this method of treating bodily ills are also to be found in the ancient manuscripts of the Egyptians, Hindus and Chinese.

Lost for centuries, the principles of this system of practice were rediscovered by Dr. Daniel David Palmer and the first chiropractic adjustment of a vertebral articulation was given by him on Sept. 18, 1895.

The founder of this system of healing, in his comprehensive text and reference work, *The Science, Art and Philosophy of Chiropractic*, published in 1910, declared that chiropractic was "the science of adjusting by hand any and all luxations of the articular joints of the human body; more especially the articulations of the spinal column,

¹ Definition officially adopted by the National Chiropractic Association in Los Angeles, July 1953.

for the purpose of freeing any and all impinged nerves which cause deranged functions." His concept included the theory that most dysfunction or disease results from a lack of tone in the tissues. The remarkable effectiveness of this method of treating disease has won for chiropractic a permanent place as one of the major professions in the family of health sciences.

Premise.—The science of chiropractic is based on the premise that disease results from a lack of normal nerve function. The efforts of the chiropractic physician are directed toward the restoration of the normal function of the nerve system, which controls all other systems and all physiological functions of the human body. The doctor of chiropractic treats, by scientific manipulation and specific adjustment, the structures of the body, especially the spinal column, to restore normal nerve function which enables the body's protective and restorative powers to function normally.

Chiropractic physicians are thoroughly trained in all methods of diagnosis and understand the significance of structural maladjustments which are always present in disease. They contend that the first requisite of health procedure is the maintenance of the mechanical integrity of the body—free from spinal defects and postural distortions. The practice of chiropractic is as broad as the nervous system, which controls the function of all organs, glands and tissues. Therefore, chiropractic is applicable to a wide variety of diseases which affect the human body and mind.

Chiropractors recognize the importance of spinal hygiene and sanitation, as well as the factors of infection, fatigue, trauma, and occupational hazards. Physiotherapeutic measures, such as light, cold, heat, air, water, diet, massage, electricity, and exercise, are used as indicated.

Educational.—To obtain recognition from the dominant organization of his profession, a doctor of chiropractic (D.C.) must have been graduated by one of the numerous approved chiropractic colleges. These schools, whose courses compare favorably with those of other scientific institutions, are located throughout the nation. The National Council on Education has established a rigorous standard for colleges seeking its endorsement. The standard approved minimum course of resident study comprises four academic years of not less than 4,000 class hours in a nonprofit educational institution having well-qualified professors and instructors and adequate library, laboratory, and housing facilities. As of 1953, eleven chiropractic colleges had received accredited ratings.

A list of chiropractic colleges meeting these requirements may be obtained by writing to Dr. L. M. Rogers, executive secretary, national chiropractic association, Webster City, Iowa. It is estimated that 2,500 new students enroll annually in chiropractic colleges. Numerous fraternities and sororities have been formed in the various colleges. The national association provides postgraduate training for doctors of chiropractic by conducting extensive research continuously and through clinical demonstrations and condensed courses given at its annual conventions, which are attended by 2,000 to 2,500 members of the profession.

Other chiropractic bodies which provide various forms of postgraduate work and are affiliated with the national organization are: The National Council of Hospitals and Sanitaria, National Council of Physiotherapy, National Council of Roentgenologists, National Council on Public Health, National Council on Research, and National Council on

Psychotherapy. The profession's outstanding periodical is the *Journal of the National Chiropractic Association*, official publication of the national association. This is supplemented by the *National News*, which is mailed to all members of the chiropractic profession. Every state has its own state association and the majority of these are affiliated with the national association. Most state societies publish their own monthly periodicals. Hospitals, sanatoriums, and clinics have been established in every state. To inform the public on chiropractic, *Healthways* magazine, a digest publication with a circulation of 110,000 copies monthly, and numerous brochures and booklets are published by the National Chiropractic Association.

In recent years chiropractic educators have made some very definite contributions to general human welfare through their studies on postural defects, sleeping habits, spinal hygiene, and correction and care of sacroiliac displacements and weaknesses. The Railroad Retirement Board, the Civil Service Commission, Workmen's Compensation Commission, Western Union Telegraph Company, and some 500 insurance companies are granting increasing recognition to the chiropractic profession due to its efficient handling of difficult accident and disability cases. The public health division of the National Chiropractic Association is conducting continuous research on the principles underlying the science of chiropractic and makes its findings known to the profession through periodical reports. Encouraging reports have been received in cases of poliomyelitis, spastic paralysis, diabetes mellitus, amnesia, and multiple sclerosis under chiropractic care.

Statistics.—The National Chiropractic Association estimated in 1953 that approximately 23,500 chiropractors were practicing in the United States and Canada, and an undetermined number were scattered throughout every civilized country of the world. The association announced that a recent survey revealed that more than 32 million people in the United States have, at one time or another, availed themselves of chiropractic service. More than 2,000,000 new patients experience the health benefits of chiropractic each year.

In 1951, the Executive Office of the President of the United States, Bureau of the Budget, classified chiropractic as one of the four major professions in the United States (804-8041) in the major group 80, which includes physicians and surgeons, dentists, osteopaths, and chiropractors. During World War II and later the Korean conflict, Congress passed S.1, which included deferment of chiropractic students as being "essential to the national health, safety and interest." Included in the scope and administration of the National Chiropractic Association are the National Chiropractic Insurance Company, the National Printing Company, and the Chiropractic Research Foundation. Activities include sponsoring of National Correct Posture Week May 1 to 7 each year, producing *Healthways-on-the-Air* radio transcriptions, *Chiropractic—A Career* brochures, two sound color movies—*Infantile Paralysis Finds a Cure* and *They Walk Again*.

As of January 1953, 43 states have granted legislative regulation to chiropractic practitioners. They are: Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Iowa, Kansas, Kentucky, Maine, Maryland, Michigan, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, North Carolina, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania,

Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, West Virginia, Wisconsin and Wyoming. In addition, the practice is legally regulated in the District of Columbia, Alaska, Hawaii and Puerto Rico; British Columbia, Manitoba, Alberta, Saskatchewan, and Ontario in Canada, and several foreign countries.

Since there are no chiropractic schools or colleges except in the United States and Canada, it naturally follows that many foreign students enroll annually. In accordance with Sect. 4(c) of the Immigration Act of 1924, certain chiropractic schools and colleges have been approved by the secretary of labor to cover residence of such students.

Executive Secretary, National Chiropractic Association, Inc.

CHIROPTERA. See CHEIROPTERA.

CHIROSOPHY, the interpretive science of the hand. See CHIROMANCY.

CHIROTES, kī-rō'tēz, **EUCHIROTES**, or **BIPES**, a lizard belonging in the family Amphisbaenidae, a wormlike, burrowing and usually limbless family. The genus *Chirotes*, however, is unique in that it retains a pair of forelegs which are extremely short and thick, and bear five digits with claws. It is eight to ten inches long, of a dusky flesh color, completely subterranean, burrowing in soft earth, and eating small insects and worms. *Chirotes* inhabits the Mexican peninsula of Lower California. See also AMPHISBAENA.

CHIROTHERIUM. See LABYRINTHODONTA.

CHIRU, chē'rōō, a large antelope (*Pantholops hodgsoni*) native to the plateau of Tibet, found at elevations of from 13,000 to 18,000 feet. It is about 32 inches tall and pale in color, with a much swollen muzzle somewhat like a moose. The buck has a black face and long horns somewhat like those of a gazelle; the doe is hornless and lacks the black face. Preferring grassy meadows to cliffs, it is very wary. This fine antelope has a thick covering of woolly hair, fawn-gray in color, and is related to the saiga of Central Asia.

CHISEL, chiz'l, an edged tool for cutting wood, iron or stone, operated by striking its upper end with a hammer or mallet, or by pressure. The form of chisel used in carpentry is the most familiar; one used in turnery has the cutting edge in the middle of the thickness, one used in metalurgy has the upper part flat for receiving the blow of the hammer, and the lower part in the form of a wedge for penetrating iron plates or bars. Some of the "celts" found in Europe in prehistoric times are believed to have been used as chisels, and these tools were known also to the ancient Egyptians. In ancient times chisels were made of stone and later of various kinds of metals. The more civilized of the native tribes of America were acquainted with the chisel. The Aztecs, Zapotecs, Mixtecas and races of Yucatan, Guatemala and other parts of Mexico made chisels of copper and stone.

CHISELMOUTH. See CHUB.

CHISHOLM, chiz'um, **Hugh**, English editor: b. London, England, Feb. 22, 1866; d. there, Sept. 29, 1924. He was educated for the bar but left the law for journalism. In 1899 he became editor of *St. James's Gazette* and in 1900 joined the staff of the *London Times*. He was coeditor with Sir Donald Mackenzie Wallace and A. T. Hadley, then president of Yale, of the tenth edition of the *Encyclopaedia Britannica* and editor in chief of the eleventh edition published in 1910-1911. He returned to the *Times* but in 1920 he reassumed the editorship of the *Britannica* for the twelfth edition. He was a sound scholar with great vision and excellent literary judgment.

CHISHOLM, Jesse, pioneer, guide, scout, interpreter and trader: b. Tennessee about 1806; d. March 1868. His father was a Scotsman and his mother a Cherokee Indian. He migrated to the West while the Cherokees occupied lands in Arkansas, being mentioned as one of the members of the tribe which accompanied Captain Dutch on his punitive expedition against the Towakony Indians in Texas, about 1827. He was one of the interpreters in the council held with the Wichita, Kiowa and Comanche tribes in the Red River country by Col. Henry Dodge and Governor Montfort Stokes, in 1834, and was prominent as a mediator in most of the councils, negotiations and treaties made between the government and the wild tribes of the Southern Plains from that time on. He became a trader among the Comanche, Kiowa and other tribes of the plains, and during the course of his trading expeditions he rescued by ransom nine captive children and youths (mostly Mexican) all of whom were adopted and reared in the family with his own children. His home was at Camp Holmes, on the Canadian River. He also established and maintained trading posts near the present towns of Lexington and Oklahoma City.

At the outbreak of the Civil War he was for a time prevailed upon to aid the Confederate authorities in negotiating treaties of alliance with various tribes in the Indian Territory but, in the latter part of 1861, was found among the refugee Indians who followed Opothleyahola northward to an asylum in Kansas. Tiring of life in the refugee camps, he soon drifted westward to the mouth of the Little Arkansas, where the Wichita and affiliated tribes of Indians had settled temporarily and where he engaged in trade.

In the spring of 1865, he went south from the Arkansas to the valley of the upper Washita on a trading trip, the road over which he traveled being ever afterward known as the Chisholm Trail, destined to become famous during the days of the overland cattle traffic. In the autumn of that year he was active in persuading the hostile Comanche and Kiowa leaders to attend the peace council at the mouth of the Little Arkansas.

Consult Taylor, T. U., *Jesse Chisholm* (Bandera, Texas, 1939).

CHISHOLM, city, Minnesota, in St. Louis County, about 8 miles northeast of Hibbing. An important mining and ore-shipping center, it is served by the Great Northern and the Duluth, Mesabe, and Iron Range railroads, and by Wisconsin Central Airlines. Industries include dairy products and beverages. Settled in 1898, Chisholm was incorporated as a town in 1901, and as a city in 1934. Pop. (1950) 6,861.

CHISHOLM v. GEORGIA, in the United States Supreme Court, the case which led the several States to protect themselves from legal responsibility to individuals, while retaining legal powers of aggression. The Constitution provides (Article III, section 2): "The judicial power shall extend to all cases—between a State and citizens of another State." Under this provision Maryland was sued soon after the adoption of the Constitution, and acknowledged process by her attorney general; but the case was compromised, and the question of jurisdiction did not come up. On July 11, 1792, Alexander Chisholm of South Carolina, as legatee in an inheritance case, served a process on the governor and attorney general of Georgia to appear before the August term of the Supreme Court. Georgia instructed its attorney general not to appear, and its counsel to enter a denial that states could be sued by individuals, or that the Supreme Court had jurisdiction in such cases, but not to argue the case. Chief Justice Jay and all the court, except Iredell of North Carolina, found that the court had such jurisdiction; and a writ of inquiry was issued, but not served because Georgia passed an act making service of it a capital offense. Virginia was as angry as Georgia; and the 11th Amendment to the Constitution was introduced into Congress, passed by two thirds of both Houses March 5, 1794, ratified by the states and declared in force Jan. 8, 1798. It reads: "The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign state." Efforts were made to get around this federal law by having a citizen assign his claim to the state of his domicile and having the suit then brought in the name of this State. But it was held that this could not be done (*New York v. Louisiana*).

CHISLEHURST and **SIDCUP**, *chíz'l-húrst* and *sid'kúp*, an urban district in Kent, England, 11 miles southeast of London. It was long the residence of William Camden, the antiquary, and was the residence of Napoleon III from his dethronement until his death in 1873. His body and that of the prince imperial (killed in Zululand in 1879) reposed here until their removal to Farnborough in 1888. Pop. (1947 est.) 71,710.

CHISWICK. See BRENTFORD AND CHISWICK.

CHITA, *chí-tá'*, a city of the Soviet Union, and capital of Chita Region. Located on the Chita and Ingoda rivers and the Trans-Siberian Railroad, it is 2,625 feet above sea level. Founded in 1653, it had a population of 102,555 in 1939. It is the center of a rich mining region and industrial development. There are several technical colleges, a university, and a medical research institute located there; also the museum of The Russian Geographical Society.

CHITA REGION, an administrative division of the Soviet Union in Asia, 180,455 square miles in area and with a population in 1939 of 1,159,478. Its capital and chief city is Chita (q.v.); other cities are Nerchinsk and Sretensk. It is located on a plateau area with the Yablonoi

Mountains on the west and extensions of the various mountain ranges of the Khabarovsk Territory on the east. Partly an agricultural region, it produces cereals and vegetables and raises cattle. As a mining district, it produces coal, iron, and various metals. It also produces timber and furs. It is served by the Trans-Siberian Railroad in the south and by the new BAM trans-continental railway in the south and east. Formerly known as Transbaikalia, it was one of the earliest settled regions of eastern Siberia. After the 1917 revolution it was part of the Far Eastern Region, but in 1936 it became a new Soviet division.

CHITALDROOG, or **CHITALDRUG**, *chít'l-dröög*, a town in Mysore state, in the South Indian Union, 137 miles north of the city of Mysore. It is noted for its great fortress, which was unsuccessfully attacked by Haidar (Hyder) Ali in 1776, captured by him in 1779, and made the place of imprisonment of General Mathews by Tipu (Tippoo) Sahib in 1783.

CHITIN *kí-tín*, ($C_{15}H_{20}N_2O_{10}$), the horny substance which gives firmness to the tegumentary system and other parts of the Crustacea, Arachnida and insects; probably also the carapace of the *Rotatoria* consists of it. It is left when the above structures are exhausted successively with alcohol, ether, water, acetic acid and alkalis. It is colorless and amorphous, and is usually classed a proteid. It is dissolved by concentrated mineral acids without the production of color. It is not dissolved by solution of potash, even when boiling; neither does it give the characteristic reactions with Milton's or Schultze's tests.

CHITON, *kí'tôn* a genus of Mollusca and the common name of the same, the shells of which are boatshaped, and consist of a median series of symmetrical plates, folding over each other, and implanted in the mantle, the marginal zone of which is studded with spicules. It is the typical genus of the family Chitonidae of the class Amphineura. The chitons cling firmly to rocks, etc., by means of the powerful foot, many of them resisting the heaviest beat of the surf. Only very small species are found on the eastern Atlantic coast, but larger species occur in Florida and the Gulf of Mexico, while California has the giants of 8 or 10 inches of the genus *Cryptochiton*.

CHITON, *kí'tôn*, the undergarment of the ancient Greeks. In the earliest times it was worn by the men only; in later times there were two forms, and the chiton was worn by both sexes. The Dorian chiton was sleeveless, reaching about to the knees, and usually left more or less open on the right side. The Ionian was a long tunic reaching to the feet, closed on the sides, sometimes sleeveless, but often with short or long sleeves. Both forms were usually worn belted in at the waist.

CHITRAL, *chí-träl'*, Indian state, in the North-West Frontier Province, Pakistan. Through it flows in a southwest direction the Chitral or Kunar River, a tributary of the Kabul, and on it, at approximately latitude 36° north, stands the town of Chitral at a height of more than 5,000 feet above sea level. The people are Moslems, but

mostly speak a language closely akin to that of their neighbors in Kafiristan (eastern Afghanistan). Timber and minerals (iron, copper, lead, antimony) are the chief resources; sword blades, textiles, and fruit are shipped from the state.

Since the 17th century Chitral has been ruled by a Moslem dynasty bearing the title of mehtar. In 1895 a dispute over the succession to the throne, coupled with disturbances attendant on fixing the Afghan frontier, resulted in the siege of the capital, Chitral. From March 4 until they were relieved on April 19, the British political agent and a small body of troops held out against a force of Chitrali and Afghans. The state became part of Pakistan in 1947. It covers an area of 4,000 square miles. Pop. (1951) 107,000.

CHITTAGONG, chit'-a-gōng, the name of a city, district, and division in Pakistan.

(1) The city, in East Pakistan (East Bengal), on the Karnaphuli River about 12 miles from its mouth on the Bay of Bengal, and 225 miles east of Calcutta, India, is the capital of Chittagong Division. A leading port and rail terminus, it ships mainly jute, cotton, tea, rice, and hides. Though situated in an unhealthy climate (the annual rainfall is among the highest in the world), Chitral has developed rapidly in the 20th century and ranks as a port second only to Karachi in Pakistan. The city, once a pirate stronghold, was called by the Portuguese, who burned it in 1538, Porto Grande, still the name of its harbor. The British East India Company acquired it in 1760. Pop. (1951) 145,777.

(2) The district, which covers an area of 2,569 square miles, borders in the southeast on Burma and in the west on the Bay of Bengal. The fertile lowlands produce jute, sugarcane, tobacco, rice and other cereals, and vegetables. Tea is raised in the northern hills. The region fell to the raja of Arakan in the 16th century; in 1668 it was captured by the Mogul nawab of Bengal, and in 1760 it came under British control. A part of Bengal Province of British India, it became a section of East Bengal, Pakistan, in 1947. Pop. (1951) 2,321,000.

(3) The division comprises the districts of Chittagong, Tippera, Noakhali, Chittagong Hill Tracts, and Sylhet. It has a total area of 16,386 square miles. Pop. (1951) 11,836,000.

CHITTAGONG HILL TRACTS, district, Pakistan, situated in the Chittagong Division of East Pakistan (East Bengal). It has an area of 5,007 square miles. The capital is Rangamati, on the Karnaphuli River, linked by steamer with the city of Chittagong. Among the chief products are tea, rice, cotton, tobacco, sugarcane, and bamboo. Pop. (1951) 289,000.

CHITTAGONG WOOD, the name given to the wood of several Indian trees of the family Meliaceae (mahogany), and especially to *Chukrasia tabularis*. A light-colored, beautifully grained wood native to the Chittagong Hill Tracts, it is used for cabinetwork, although it does not wear too well in changeable climates. The name is also applied to the wood of *Toona ciliata*.

CHITTAMWOOD or **AMERICAN SMOKE TREE**, a species (*Cotinus obovatus*) of the cashew family, Anacardiaceae. It is a small tree with widespread branches attaining a height of about 30 feet, native to the rocky hills

of the Ozark region, southern Missouri to Oklahoma; and to central Texas, Alabama, and Tennessee. The orange-yellow heartwood yields a rich dye, and the timber is often used locally for fence posts because of its durability in contact with the soil. The common smoke tree, much cultivated, is *Cotinus coggygia*, a native of Eurasia. The species of the genus *Cotinus* have simple leaves in contrast to the typical pinnate form of the leaf of the sumac (*Rhus*), the latter being the principal American genus of this chiefly tropical family. The fruiting stalks of *Cotinus* have fine hairs which give the shrub or tree a smoky appearance after flowering, but in the American species these are rather inconspicuous.

Bumelia lanuginosa, a sapotaceous tree of the southeastern United States, is also known as chittamwood; and the bark of *Rhamnus purshiana*, the cascara buckthorn of the Pacific coast region, which yields cascara sagrada (q.v.), is called chittam (or chitem) bark.

CHITTENDEN, chit'-n-dēn, Hiram Martin, American military engineer and historian: b. Yorkshire, Cattaraugus County, N. Y., Oct. 25, 1858; d. Seattle, Wash., Oct. 9, 1917. After graduation from the United States Military Academy (1884), he rose through various grades to be lieutenant colonel of volunteers in the Spanish-American War. He retired as a brigadier general in 1910. An authority on water-control projects, he supervised government works in Yellowstone National Park and elsewhere, and published *The Yellowstone National Park: Historical and Descriptive* (1895); *The American Fur Trade of the Far West* (3 vols., 1902); *The History of Early Steamboat Navigation on the Missouri River* (1903); and *Flood Control* (1915).

CHITTENDEN, Russell Henry, American chemist and educator: b. New Haven, Conn., Feb. 18, 1856; d. there, Dec. 26, 1943. After being graduated from Sheffield Scientific School, Yale University, in 1875, he served as an assistant and instructor of chemistry there until 1878, when he went to Heidelberg, Germany, for further study. Returning to New Haven in 1879, he received his Ph.D. degree from Yale in the following year. He was appointed professor of physiological chemistry at the university in 1882, and from 1898 to 1922 served as director of the Sheffield Scientific School. Chittenden was the first to isolate glycocoll and glycogen in living tissue. His notable research was concerned principally with the biochemistry of digestion and nutrition. He edited *Studies in Physiological Chemistry* (4 vols., 1884; 1901). Among his other published works are *Digestive Proteolysis* (1895); *Physiological Economy in Nutrition* (1905); *The Nutrition of Man* (1907); *History of the Sheffield Scientific School* (2 vols., 1928); and *Development of Physiological Chemistry in the United States* (1930).

CHITTENDEN, Thomas, American public official: b. East Guilford, Conn., Jan. 6, 1730; d. Williston, Vt., Aug. 25, 1797. A leading resident of Salisbury, Conn., where he held various public offices, he moved in 1774 to Vermont, settling on the New Hampshire Grants and acquiring a fortune from his lands. With Ira Allen (q.v.), he drew up a constitution for Vermont, and in 1778 became its first governor, serving (except for the year 1789-1790) in this capacity until shortly

before his death. During the latter part of the Revolutionary War he made overtures to both the British and the Continental Congress in an endeavor to have the state's independence recognized.

His son, MARTIN CHITTENDEN (1763–1840), was also governor of Vermont, from 1813 to 1815.

CHITTIM. See KITTIM.

CHITTOOR, chīt-tōor', the name of a city and district in India.

(1) The city, about 90 miles west of Madras, serves as the capital of the district. It is the trading center of an agricultural region producing rice and oilseeds. Pop. (1941) 27,835.

(2) The district, an administrative division of the state of Madras, has an area of 5,951 square miles. Pop. (1951) 1,810,377.

CHITTUR, chīt'tōor, city, India, situated in an enclave of the state of Travancore-Cochin within the state of Madras, 38 miles east-north-east of Trichur. It has cotton gins, rice mills, and establishments producing tile and hand-woven cloth. Pop. (1941) 12,732.

CHITTY, chīt'i, Joseph, English legal writer: b. 1776; d. London, England, Feb. 17, 1841. Called to the bar in 1816, he practiced until 1833, when he retired because of ill health. He trained many lawyers and acquired a considerable reputation for his law manuals, including *A Treatise on Bills of Exchange* (1799); *A Treatise on the Law of Nations* (1812); *A Treatise on the Criminal Law* (1816); *A Treatise on Commercial Law* (1818); and *A Treatise on Medical Jurisprudence* (1834).

His four sons, also lawyers, were JOSEPH (d. 1838), author of *Chitty on Contracts* (1841); THOMAS (1802–1878), author of *Forms of Practical Proceedings* (1834); EDWARD (1804–1863), author of *Equity Index*; and THOMPSON (d. 1863).

His grandson, SIR JOSEPH WILLIAM CHITTY (1828–1899), son of Thomas, was called to the bar in 1856. He became a justice of the Chancery Division in 1881, and a lord justice of appeal in 1897.

CHIUSI, kyōō'sē (ancient CLUSIUM; Etruscan CHAMARS), commune, Italy, situated in Tuscany, in Siena Province, about 40 miles southeast of the city of Siena. A railroad junction and agricultural market, it stands on a hill 1,200 feet high, at the southern end of the Val di Chiana and 1.5 miles south of Lake Chiusi. The 12th century cathedral has a fine bell tower and contains many medieval inscriptions and a collection of 15th century illuminated manuscripts. The local museum houses only part of the wealth of artifacts excavated in the vicinity; large collections are in the Etruscan museums of Florence and Palermo. Near Chiusi is a vast necropolis, which testifies to the wealth and greatness of Etruscan Chamars. The tombs found there are of various kinds: round tombs with a cinerary urn in the center, from early times, when cremation was customary; chamber tombs hewn in the rocks, some of which are decorated with paintings and stone carvings, dating from the 6th century B.C. and after; and, from a later period, graves. Many, such as the Casuccini and Monkey tombs, contain several urns. While the earliest tombs contained only Etruscan artifacts, later ones yielded also objects imported from Greece, such as the famous *François Vase*,

the finest found at Chiusi. Mirrors, a variety of ornaments, and, in later tombs, thousands of bilingual Latin and Etruscan inscriptions were also found.

Chiusi came in contact with Rome at an early time. From there the semilegendary king, Lars Porsena, marched on Rome in the late 6th century B.C., and took the city to reinstate the Tarquins as kings. As one of the most powerful of the 12 Etruscan lucumonies, Chamars reached the zenith of its power and artistic development in the 5th century B.C. In the 4th century it was an ally of Rome, but a century later it was forced to submit to Roman rule. Pop. (1951) 8,641.

CHIVALRY, shiv'äl-rī (Old French *chevalerie*, from *chevalier*, horseman or knight), a term which indicates strictly the organization of knighthood in the Middle Ages, and, in a general sense, the spirit and aims which distinguished the knights of those times. Its chief characteristics were a warlike spirit, a lofty devotion to women, inspired by the widespread veneration of the Virgin Mary, a love of adventure, and a thirst for glory.

Under the feudal system the European peoples were united by some political ties, but they lacked that intimate connection which bound men together in the communities of antiquity, and the one strong bond of union was the Roman Catholic Church. The influence of a common religion was of great service during periods of turbulence, for it preserved the fabric of society. To this bond can be ascribed the great uniformity which prevailed during the ages of chivalry.

Development.—The chivalric character had not reached its full development in the age of Charlemagne. The courage displayed by the warriors of his time was that of individuals in bodies, and the independence which distinguished the knight-errant who sought adventures far and wide was the growth of a later period. By the 10th century knighthood had become an established and well-defined institution, but it was not until the 14th century that its honors were confined exclusively to the nobility. The Crusades gave a more religious quality to the spirit of chivalry, and they made the knights of the Christian countries known to each other, so that thereafter they exhibited great uniformity. Out of this period arose the great religious orders of knights (see ORDERS AND DECORATIONS). Gradually the whole establishment of knighthood assumed a more formal character. In the end it degenerated into quixotic extravagance, or dissipated its spirit in forms and punctilios.

Education of a Knight.—A boy of noble birth was sent at about his 12th year as a page to the court of some baron or knight, where he passed his time chiefly in attending the ladies and in acquiring skill in riding, in the use of arms, and in other accomplishments. When age and experience in the use of arms had qualified the page for war, he became a squire with, among other duties, that of carrying the shield of the knight whom he served. The third and highest rank of chivalry, that of knighthood, was not conferred before the 21st year except in cases of distinguished birth or great achievements. The individual prepared himself by confessing and fasting, and religious rites were performed. Then, after making a number of vows, including promises to be faithful, to protect women and orphans, never to lie or utter slander, and to live in harmony with his equals, he received the accolade. See also KNIGHT.

Influence.—In many respects, chivalry exercised a salutary influence at a time when conditions were unsettled and laws little regarded. Although it often carried the ideals of love and honor to an extreme, the reverence paid to them helped to prevent society, in a period of lawless violence, from relapsing into barbarism. Moreover it alleviated to some extent the evils of the feudal system. In the field of poetry the influence of chivalry was very great. The troubadours in the south of France, the trouvères in northern France, the minstrels in Great Britain and the minnesingers in Germany sang the deeds of the knights who received them hospitably. In Provence arose the courts of love (see COURT OF LOVE), which decided the poetical contests of the knights. In Germany the chivalric spirit produced the great epic of the *Nibelungenlied* (see NIBELUNGENLIED, THE). It was the spirit of chivalry which led to the Crusades, and from the intercourse with the Middle East which developed in this period the wonders of the Orient were introduced into chivalric poetry. This poetry existed apart from any influence of this kind, however, and really began with the cycle of King Arthur (see ARTURIAN ROMANCES, THE), which furnished materials that found poetic treatment in the various European countries. A second cycle is that of Charlemagne and his paladins, which remained a poetical foundation of chivalric poetry for many centuries. Alexander the Great also became a great hero of chivalric poetry (see ALEXANDER, ROMANCE OF). The *Amadis de Gaula* (q.v.), a prose romance which developed in Portugal and Spain, does not rest on any historical foundation.

Bibliography.—Gautier, Léon, *La chevalerie* (Paris 1884); Prestage, Edgar, ed., *Chivalry* (New York 1928); Kilgour, R. L., *The Decline of Chivalry As Shown in French Literature of the Middle Ages* (Cambridge, Mass., 1937); Painter, Sidney, *French Chivalry* (Baltimore 1940); Cohen, Gustave, *Histoire de la chevalerie en France au moyen âge* (Paris 1949).

CHIVASSO, kê-väs'sô, commune, Italy, situated in Piedmont, in Torino Province, 13 miles northeast of Turin, at the junction of the Cavour Canal and the Po River. It is the market town for the cereals and hemp produced in the vicinity, and has steelworks, tanneries, and textile mills. The cathedral, begun in 1415, has a richly ornamented façade. An octagonal tower is all that remains of the palace of the marquesses of Montferrat, who ruled the town until 1431, when it passed to the house of Savoy. Pop. (1951) 12,652.

CHIVE or **CIVE**, a hardy perennial (*Allium schoenoprasum*), native to Europe and Asia, of the lily family (Liliaceae), which grows in compact tufts or clusters. The compact mass is formed by the intertangling of the fibrous roots. The leaves are very numerous, erect, slender, hollow, pointed, and deep green. The underground portion of the separate stems is slightly swollen and covered by a thin membrane. The tender young leaves are cut and used for seasoning soups, salads, stews, cottage cheese, and other foods.

The durable plants are frequently used for ornamental purposes and make an attractive border with their rose-purple flowers. The chive is readily grown from seed and propagates well by division of the clumps.

CHIVERS, chiv'ērz, **Thomas Holley**, American poet: b. near Washington, Ga., Oct. 18, 1809; d. Decatur, Ga., Dec. 18, 1858. After receiving

his M.D. degree from Transylvania University, Lexington, Ky., in 1830, he practiced medicine for a time but soon devoted himself entirely to writing. In 1845 he published a collection of poetry, *The Lost Pleiad and Other Poems*. It was followed by other volumes of verse, including *Virginiaia*, or *Songs of My Summer Nights* (1853) and *Atlanta, or the True Blessed Island of Poesy* (1853), and by a play, *The Sons of Usna: A Tragi-Apotheosis in Five Acts* (1858). Chivers, who knew Edgar Allan Poe well, shows affinities in his verse and aesthetic theories to the writings of his friend, and after the latter's death was accused of plagiarism. While this charge is still being debated, most critics agree that both poets were influenced by each other's works.

CHKALOV, ch'ká'lóf, **Valeri Pavlovich**, Soviet aviator: b. Orenburg, Russia, Feb. 2, 1904; d. near Moscow, Dec. 15, 1938. Trained as a pilot in the Soviet Air Force, he became a military test pilot and in 1935 received the Order of Lenin for his work in this field. In the following year he commanded a nonstop flight from Moscow to Nikolaevsk along a difficult Arctic route, proving the practicability of long-distance Arctic aviation. He served as chief pilot of a Soviet plane which made a pioneer nonstop flight of 5,670 miles from Moscow to Vancouver, Wash., via the North Pole in 1937. Killed in an accident while testing a new plane, he was given a state funeral and buried in the wall of the Kremlin. After his death the city and region of Orenburg, an island off Kamchatka, and several other places were named Chkalov in his honor.

CHKALOV (formerly called **ORENBURG**), city, USSR, situated in the Russian SFSR, on the Ural River, southwest of the Southern Urals and 236 miles southeast of Kuibyshev. The capital of Chkalov Region, it has large flour mills, an extensive light industry, and machine-building plants. The city, known as Orenburg until 1938, was founded in 1735 on the site of Orsk as a Cossack fortress, and was moved to its present location in 1743. It was the scene of heavy fighting during the revolution of 1917. Pop. (1939) 172,925.

CHKALOV REGION, administrative division, USSR, in the Russian SFSR, below and around the Southern Urals. Covering an area of 47,787 square miles, it is an almost treeless steppe crossed by the Ural and Samara rivers. Wheat and sunflowers are the chief crops. Cattle raising is important in the west, while the arid east has large herds of sheep and camels. Coal, iron, petroleum, oil-bearing shale, copper, nickel, phosphorites, and salt are mined, and refining, machine building, and food processing are the chief industries. The capital is Chkalov. Although the population includes various Asian peoples, Russians predominate. Pop. (1950) 1,800,000.

CHLADNI, kläd'nê, **Ernst Florens Friedrich**, German physicist: b. Wittenberg, Germany, Nov. 30, 1756; d. Breslau, April 3, 1827. Of Bohemian parentage, he was graduated from the University of Leipzig in 1782. Chladni is known chiefly for his pioneer work in acoustics, to which he was led by his interest in music. He showed that the communication of vibrations in material bodies is subject to constant mathematical laws (see also CHLADNI'S FIGURES). He also measured the velocity of sound in gases, and was one

of the first to demonstrate that meteorites could not have originated on earth. In addition, he invented two musical instruments, the euphonium and the clavicylinder. His published works include *Entdeckungen über die Theorie des Klanges* (1787); *Die Akustik* (1802); *Neue Beiträge zur Akustik* (1817); and *Über Feuermeteore und die mit denselben herabgefallen Massen* (1820).

CHLADNI'S FIGURES are figures made by sand on vibrating plates with free edges, indicating the position of the nodes. Their shape depends on the shape of the plate and the node in which it is made to vibrate.

CHLAMYPHORUS, klà-mif'ò-rüs, or **CHLAMYDOPHORUS**, a genus of armadillos, the nearest relative of which is *Burmeisteria*. There is one species, *C. truncatus*, the pichiciego. The length of head and body without the pelvic shield and tail is about four inches. The eyes are small, and there is virtually no external ear. The dorsal shield, composed of some 25 pointed plates, which is closely articulated with the head shield, is attached to the trunk only along the median line of the back. Posteriorly, it ends abruptly, and the rear end of the body is closed by a bony pelvic shield through the lower part of which the stiff tail, with a flattened tip, projects. The entire body is clad with a thin coat of very fine, silky white hairs. There are two pectoral mammae, and two young are said to be born. In *Acta Zoologica Lilloana* (vol. 3, 1945), Dr. J. D. L. Minoprio of Argentina shows a photograph of the animal's sleeping position: the back greatly arched upward, bringing the head and pelvic shield close together, so that the body appears to rest on head and tail. In this position the forefeet seem to act as balancers. The pichiciego is reputed to be nocturnal and to feed almost entirely on worms and insects. It digs its burrows with great rapidity in the sandy waste places of Mendoza Province, Argentina. Three subspecies, *truncatus*, *palquiensis*, and *menor*, are recognized by Minoprio.

CHLAMYS, klà'mis, in costume, a light and freely flowing mantle or cloak worn as an outer garment in ancient Greece. It was oblong in shape, generally twice as long as its width, and was fastened either in front or at the shoulder. The chlamys worn by the young man was probably yellow, while that of the soldier was scarlet.

In zoology, it is the name of a genus of coleopterous insects belonging to the family Chrysomelidae. There are only a few North American species, none of which is of large size.

CHLIDANTHUS, klì-dán'thüs, a genus of two tropical American, lilylike plants belonging to the amaryllis family. The leaves are linear and basal, and the bright yellow, fragrant flowers are borne in umbels on erect scapes. *C. fragrans* is rather commonly cultivated.

CHLOASMA, klò-äz'mà, a deposit of pigment in the skin, occurring in patches of varying sizes and shapes. These patches may be yellow, brown, or black in color. The condition is often associated with derangement of the endocrine system. If the pigment is melanin, the chloasma is known as melanosis. The general condition of chloasma is often due to irritation of the skin caused by exposure to the sun's rays, or by the

action of mechanical, chemical, or infectious agents. Chronic irritation of the skin from dust, sweat, and vermin may produce the condition known as vagabond's disease. The pigment present in Addison's disease is a true melanosis. Other examples are freckles and pigmented nevi. Occasionally carcinoma arises from a pigmented nevus regarded as a harmless mole. As a rule, melanosis is in fact harmless and requires no treatment beyond removal of the exciting cause, if it can be found.

HAROLD WELLINGTON JONES, M.D.

CHLOPICKI, klò-pëts'kè, Józef, Polish general: b. Galicia, March 14, 1771; d. Kraków, Sept. 30, 1854. At the age of 16, he joined the Polish Army, and in 1794 served under Thaddeus Kosciuszko in the rebellion following the second partition of Poland. Entering the service of Napoleon, he fought in Italy and Spain and took part in the battles of Eylau, Friedland, and Smolensk. Returning to Poland after the fall of Napoleon, he joined the Russian Army, in which he served until 1818. At the outbreak of the Polish Revolution of 1830, he was chosen dictator, but soon resigned because of his opposition to the policies of the revolutionary leaders and joined the army fighting the Russians. Wounded in February 1831, he retired to Kraków.

CHLORAL, klò'räl, the common name for trichloroacetaldehyde, $\text{Cl}_3\text{C}-\text{CHO}$. It is a colorless liquid which freezes at -58.5°C ., and boils with some decomposition at around 97.5°C . Chloral is made commercially by the chlorination of ethyl alcohol, $\text{C}_2\text{H}_5\text{OH}$. The reaction takes place in a series of steps involving the oxidation of alcohol to acetaldehyde, polymerization to paraldehyde, and chlorination. In the batch process chlorine is passed slowly over ethyl alcohol until the product attains a density of around 1.5. A continuous process involves the employment of a series of kettles with increasing temperatures from one to the next. Chloral alcoholate, an addition product, is broken up by sulphuric acid, and the chloral vaporized from the mixture. Another process involves the electrolytic oxidation of alcohol in the presence of potassium chloride. Acetaldehyde may be chlorinated directly.

About 3 million pounds of chloral are produced annually in the United States. Its chief industrial use is in the synthesis of the insecticide commonly known as DDT. This material has as its chief constituent dichlorodiphenyl-trichloroethane, $\text{Cl}_2\text{C}-\text{CH}(\text{C}_6\text{H}_4\text{Cl})_2$. The chlorine atom on each benzene ring is in the para position.

Chloral reacts with sodium hydroxide to yield chloroform and sodium formate, $\text{Cl}_3\text{C}-\text{CHO} + \text{NaOH} = \text{CHCl}_3 + \text{HCO}_2\text{Na}$. This reaction is thought to have suggested the possibility of producing an anesthetic, or at least a hypnotic, from chloral.

Chloral Hydrate.—Chloral has the power of adding a variety of compounds, of which water is the most important. Chloral hydrate has the formula $\text{Cl}_3\text{C}-\text{CH}(\text{OH})_2$, and is particularly interesting to organic chemists because it is a very rare example of a stable compound in which two hydroxyl groups exist on a single carbon. Carbonic acid has the formula $\text{O}=\text{C}(\text{OH})_2$, but it can exist only in water solution. The presence of the three strongly negative chlorine atoms on the adjacent carbon is thought to be the reason for the relative stability of chloral

hydrate. This substance, a crystalline solid melting at 50°C., was formerly used very extensively in medicine as a soporific, but with the introduction of much safer sleep-producing substances, such as the barbiturates, chloral hydrate has practically disappeared from among pharmaceuticals. It is very irritating to the stomach, fatal in overdoses, and also very habit forming.

Other Additives and Derivatives.—Other chloral additives are chloral alcoholate, chloral ammonia, chloral caffeine, chloralformamide, and chloralimide. A somewhat similar substance is butyl chloral, 2,2,3 chlorobutanol, $\text{CH}_3\text{CH}(\text{Cl})\text{CH}_2\text{CHO}$, which is used in medicine as a sedative.

Two chloral derivatives which are used as substitutes for chloral hydrate are sometimes mistaken for each other because of the similarity of their common names. The one, chloralformamide, is also incorrectly called chloralimide. The other is chloralimide. The formula of chloralformamide is $\text{Cl}_3\text{C}-\text{CHOH}-\text{NHCHO}$, while that of chloralimide is $(\text{Cl}_3\text{C}-\text{CH}=\text{NH})_2$. The former is said to be slower and safer in its action as a soporific than chloral hydrate. Chloralimide, which is prepared by the reaction between chloral and ammonium chloride, is a tasteless, odorless crystalline material, employed as an antipyretic and analgesic.

W. T. READ,
Research and Development Division, General Staff, Department of the Army.

CHLORAL HYDRATE. See **CHLORAL**.

CHLORAMPHENICOL. See **ANTIBIOTICS**.

CHLORASTROLITE, klōr-ās'trō-lit, a mineral found in the form of rounded pebbles of radiated structure on the shores of Isle Royale, Lake Superior, and derived from the traprock in the vicinity. It is bluish green in color, with a hardness of 5.5 and a specific gravity of 3.18, and can be given a high polish. Some authorities consider it to be an impure variety of prehnite, but optical considerations have led to the view that it should be classed under thomsonite.

CHLORATES, klō'rätz, the metallic salts of chloric acid. They are all more or less soluble in water, potassium chlorate being least soluble. All of them are decomposed by heat, with the evolution of oxygen. See also **CHLORIC ACID**.

CHLORIC ACID, klō'rīk, a colorless, strongly acid liquid, having the formula HClO_3 , and a specific gravity of 1.28. It combines with bases to produce the salts known as chlorates. Potassium chlorate is formed directly when chlorine gas is passed through a warm, concentrated solution of caustic potash. By treating this salt with sulphate of ammonia and adding barium hydrate, barium chlorate, $\text{Ba}(\text{ClO}_3)_2$, is formed; from it chloric acid is set free by the action of dilute sulphuric acid. The clear solution is decanted from the precipitated barium sulphate and evaporated over strong sulphuric acid in a vacuum until the residue contains 40 per cent of pure chloric acid. A further concentration leads to decomposition. This aqueous acid is colorless and has a pungent odor and a sour taste. When exposed for a time to the light, it changes to perchloric acid. Because of the facility with which it parts with its oxygen, chloric acid has power-

ful bleaching properties. Paper dipped into a strong solution of the acid takes fire spontaneously on drying owing to the great rapidity of its oxidation. The most important salt of chloric acid is potassium chlorate, which is used in the preparation of oxygen gas, the manufacture of matches, and medicine. It crystallizes in monoclinic plates with a specific gravity of 2.35.

CHLORIDES. See **HYDROCHLORIC ACID**.

CHLORIMETRY or **CHLOROMETRY**, the art of estimating the quantity of chlorine in bleaching powder or other hypochlorite.

CHLORINE, klō'rēn, a readily liquefied, greenish yellow gas. As a gas, under room conditions, it is about two and one-half times as heavy as air. As a liquid, it is shipped in steel cylinders or tanks at 150 pounds per square inch, and is about 35 to 40 per cent heavier than water. Its boiling point at atmospheric pressure is 34°C. below zero (29.2°F. below zero); its melting point, about 100°C. below zero (148°F. below zero). Chlorine is an element (in the chemical sense) with the symbol Cl , atomic number 17, and atomic weight of 35.457. It is second to the lightest in the group of four elements known as the halogens (see **HALOGEN**), all of which have analogous acidic, or salt-forming, properties.

Chlorine is actually a mixture of essentially two isotopes, consisting of about 75 per cent and 25 per cent chlorines of nearly 35 and 37 atomic weight, respectively. In addition, radioactive (synthetic) isotopes of atomic weight 33, 34, 36, and 38 have the atomic configuration of chlorine.

The element is one of about a dozen heavy chemicals of major industrial importance. It is also one of a very small number of industrial chemicals of tonnage importance (aside from metals) which are shipped and sold in the elemental state.

Historical Development.—The discovery of chlorine is usually attributed to the great Swedish chemist Karl Wilhelm Scheele (q.v.), in 1774. He named it "dephlogisticated marine acid air," a conception which visualized chlorine as an oxidized form of a part of sea (common) salt. Antoine Laurent Lavoisier also considered it an oxidized gas, but Sir Humphrey Davy (qq.v.) showed that the substance was not a compound of oxygen but a simple substance or element, and because of its peculiar yellowish-green color he gave it the name "chlorine," from the Greek *chlōros*.

For about 100 years after its discovery chlorine had little industrial importance, but by the latter part of the 19th century the Weldon and Deacon processes for producing it by chemical reactions were operated commercially. Both of these processes oxidized as the raw material hydrogen chloride, which was obtained from the treatment of salt with sulphuric acid. In the first process oxidation was conducted with manganese dioxide; the second used air with a copper chloride catalyst. In both processes the chlorine gas was dilute but was suitable for making bleaching powder, which then served as the principal method of transporting the product.

Early in the 20th century the development of direct-current generating equipment made the electrolytic method of preparing nearly pure chlorine commercially feasible. The element then

developed with phenomenal rapidity as one of great industrial importance. During the first half of the 20th century the production of chlorine grew by leaps and bounds, much faster than the rate of general industrial progress and even faster than that of the chemical industry as a whole. Toward the end of World War II, the annual United States consumption of chlorine was approximately 20 pounds per capita; German consumption, about 15 pounds; and Japanese, about 2 pounds. In the mid-1950's the element was being shipped in the United States in trainload lots, and there were also a number of high-capacity barges in use. In addition, substantial quantities were being shipped by pipeline from supplier to consumer.

Source.—The ultimate source of practically all of the chlorine of commerce is common salt, or sodium chloride, which is very widely distributed in nature. Most of the chlorine produced in the United States by the electrolysis of common salt is obtained by the direct treatment of a saturated or nearly saturated brine. Despite the extremely rapid growth of the demand for and uses of chlorine, the demand for sodium products is still higher, so that most of the chlorine mined with salt is unused. Furthermore, the utilization of chlorine is not, generally speaking, at its highest efficiency. In the manufacture of most chlorinated chemicals by the direct use of chlorine, there is formed much hydrogen chloride, which is sold at low prices.

Manufacture.—The first half of the 20th century saw an intensive development of the electrolytic cells used for the manufacture of chlorine. Two general types of cells in common use are the diaphragm cell, which uses a diaphragm to separate gaseous chlorine from gaseous hydrogen; and the mercury cathode cell, which forms a sodium amalgam which is reacted with water to caustic soda and hydrogen in a separate chamber. About two thirds of the approximately 350 patents which have been issued in the United States on caustic and chlorine cells have been issued on diaphragm cells, and one third on mercury cells. Of all these patents less than one tenth (when considering distinct types) have been reduced to commercial practice, and of those so reduced only about half have been able to survive the combination of engineering imperfection, insufficient capital, and unfavorable operating or business conditions. As of 1953, approximately 120 chlorine factories (including some 65 in the United States) were conducting reasonably profitable operations.

Hazards.—Although chlorine is toxic, its extremely pungent and disagreeable odor has resulted in the fact that there have been substantially no fatalities, and relatively few serious accidents, in connection with its widespread production and use. Chlorine attacks the mucous membranes of the nose and throat, and when small quantities are breathed for some time, an irritating cough accompanied by bloody sputum develops. When breathed in considerable quantities, it causes serious congestion of lung tissue, which, in extreme cases, may be fatal.

A few parts of chlorine per million in the atmosphere are detected by most human olfactory nerves, but this concentration is safe almost indefinitely. About twice the concentration just barely detectable is oppressive to most persons. Four parts per million can be borne without severe effect for one-half to one hour; a concen-

tration of 50 to 60 parts per million causes dangerous illness in the same period. Activated charcoal gas masks, which are commonly available in all chlorine plants and in places where chlorine is used, offer full protection.

One of the biggest hazards in connection with chlorine is the fact that mixtures of it with hydrogen are extremely explosive. Moreover, some of the nitrogen compounds of chlorine are readily detonated by shock. Despite these hazardous characteristics, however, both the producing and the consuming industries in the United States can be said to have an enviable safety record.

Uses.—Chlorine (including such forms as several types of bleaching powder, sodium chlorites, and chlorine dioxide, etc.) is a very widely used bleaching agent. In particular, the bleaching of wood and other vegetable pulp, especially kraft pulp, uses large tonnages of chlorine. The digestion of such fibrous materials as bamboo and straw, in which the action is more than merely bleaching, produces high-grade paper raw materials. With minor exceptions, chlorine is too destructive to use in bleaching wool, silk, and other products of animal origin, such as feathers.

Probably the fastest growing use of chlorine is in the manufacture of many organic, and some inorganic, compounds containing chlorine. In this respect, the element can be considered one of the most powerful tools in the synthetic chemical industry. Chlorinated products are adapted to a wide variety of end uses. Among the organic products are chlorinated (fireproof) solvents from acetylene and ethylene; trichloroethylene; carbon tetrachloride (fire extinguisher and solvent); chlorobenzenes and chlorotoluenes; ethylene glycol; antiknock fluids; synthetic plastics; synthetic rubbers; refrigerants; lubricant additives; chlorinated naphthalene; agricultural chemicals, such as insecticides and weed killers; intermediates; and miscellaneous products. Among the inorganic products are bromine (for antiknock fluids and photographic chemicals); hydrogen chloride and hydrochloric acid; metallic chlorides for the metallurgical and general chemical fields; sulphur monochloride and dichloride; phosphorus trichloride and pentachloride; and a host of oxidizing and bleaching compounds.

The metallurgical uses of chlorine include various methods for the extraction of copper, lead, zinc, nickel, gold, platinum, silver, titanium, tungsten, and vanadium.

One of the most important uses of chlorine is in sanitation. The purification of drinking water and the sterilization of sewage effluents consume a significant fraction of chlorine—one of much greater importance than its quantity might indicate. Many household disinfectants represent similar end use of chlorine. Chlorine is a very powerful bactericide, and as an algicide it is extremely effective when used in periodic doses.

Coproducts.—A number of important industrial chemicals are produced as coproducts with chlorine. Sodium or potassium hydroxide and hydrogen are produced by the electrolysis of the corresponding chloride brines. Metallic sodium, metallic magnesium, and, to a small extent, calcium and lithium are produced by the electrolysis of the corresponding fused chlorides. Sodium nitrate is produced as a coproduct in the treatment of common salt with nitric acid. In fact, the most important of the coproducts is sodium hydroxide or caustic soda, which is a coproduct of approximately three fourths of the

chlorine used commercially in the United States.
Z. G. DEUTSCH,
Deutsch and Loonam, Consulting Engineers and Metallurgists.

CHLORIS, klô'ris, the name of three characters in Greek mythology.

(1) The goddess of flowers and the wife of Zephyrus, identical with the Roman Flora.

(2) The daughter of Amphion of Orchomenus. She was the wife of Neleus and the mother of Nestor.

(3) The daughter of Niobe and of Amphion of Thebes. When the children of Niobe were killed, she and her brother Amyclas alone escaped, and she became so pale from terror that her name was changed to Chloris, meaning "yellowish green."

CHLORITE GROUP, klô'rit, in mineralogy, a group of minerals crystallizing in the monoclinic system, exhibiting a green color from the presence of ferrous iron, and chemically definable as hydrous silicates of aluminum, ferrous iron, and magnesium. They are usually secondary minerals, derived from pyroxene, amphibole, and other forms. Although they exhibit a marked basal cleavage suggestive of mica, they differ from mica and its allies by not containing any considerable amounts of calcium or of the alkalis.

CHLORITE SCHIST. As chlorite is a general name for green, secondary, hydrated silicates containing aluminum and iron (see **CHLORITE GROUP**), so chlorite is used as a prefix to various names of rocks that contain such silicates, as in chlorite schist. In the wide belt of Algonkian and Archean rocks stretching from Labrador to the western end of Lake Superior there are great areas of chlorite schists resulting from the alteration of sedimentary and igneous rocks.

CHLOROFORM, klô'rô-fôrm, trichloromethane (formula CHCl_3), a heavy, colorless liquid having a sweet, burning taste and a characteristic ethereal odor. Commercial chloroform contains up to 2 per cent by volume of alcohol. It may be formed by the action of caustic potash on chloral and, on a large scale, by distilling water and alcohol with chloride of lime. It boils at 61°C ., and at 25°C . has a specific gravity of 1.476, dissolving in 210 volumes of water. It should be kept in light-resistant containers at a temperature below 30°C . Chloroform is used as an organic solvent and as an anesthetic, anodyne, and antispasmodic. As a general anesthetic, it is more powerful and quicker in action than ether (q.v.), but in unskilled hands is much more dangerous. Occasionally it is administered by the mouth as a carminative. It is also used in liniments, since it is a powerful skin irritant. If given in large doses internally, it is dangerous.

Chloroform was discovered independently by Samuel Guthrie (1782-1848) of Sackett Harbor, N. Y., who produced it by distillation; Eugène Soubeiran (1793-1858) of Paris, France; and Baron Justus von Liebig (1803-1873) of Giessen, Germany, the discoverer of chloral. The three men published their work in 1831-1832, and are accorded equal honor. The anesthetic value of chloroform was discovered in 1847 by Sir James Young Simpson (1811-1870), and its further use on a scientific and popular basis was developed by John Snow (1813-1858).

When it is inhaled, chloroform is absorbed rapidly through the mucous membrane of the respiratory tract. When given by mouth, it causes irritation of the gastrointestinal mucosa, and its absorption is rapid. During anesthesia chloroform acts successively on the cerebrum, cerebellum, and the sensory and motor sides of the spinal cord. This action first causes sleep and then, in succession, loss of sensibility, loss of reflexes, muscular relaxation, and respiratory and vasomotor paralysis. The action of chloroform is quite similar to that of ether, but several times the quantity of ether is required to produce the effects of chloroform anesthesia.

Since it is some eight times as powerful as ether, chloroform is a definite circulatory depressant, and herein lies its greatest danger. The depressant action is caused principally by the effects of the drug on the vasomotor center and the blood vessels rather than on the heart itself. When it is inhaled, chloroform is eliminated rapidly by the body, about half the quantity administered leaving the system within 30 minutes. The drug causes very considerable metabolic disturbances, such as acetoneuria and acidosis. Untoward effects and acute poisoning occasionally result from the use of chloroform, and, despite the contrary impression prevailing, children are as vulnerable as adults. Sudden death has occurred after a few whiffs of the anesthetic, or following short but painful operations (such as tooth extractions) when the anesthesia has been incomplete or imperfect. The margin of safety between the anesthetic dose and the lethal dose is a narrow one. Early signs of collapse in chloroform anesthesia are usually well marked, and are shown by increasing pallor, respiratory failure with short and inefficient expiration, gasping, irregular and broken inspiration, and great dilatation of the pupils. In fatal cases the patient suddenly becomes deathly pale as the heartbeat ceases. The real value of chloroform as an anesthetic lies in its analgesic and antispasmodic properties when it is inhaled in small quantities. Despite its usefulness it has been largely superseded by ether. In the convulsions of tetanus and rabies, however, and in renal and biliary colic, when morphine is unavailable or contraindicated, chloroform is sometimes a source of great relief.

The most important preparations of chloroform are the pure drug (99.5 per cent chloroform to 0.5 per cent alcohol), spirits of chloroform, and chloroform liniment. See also **ANAESTHESIA**.

HAROLD WELLINGTON JONES, M.D.

CHLOROMYCETIN. See **ANTIBIOTICS**.

CHLOROPHANE, klô'rô-fân, in mineralogy, a variety of fluorspar, or fluorite, which, when warmed, shines with a green phosphorescent light. Fine specimens are found in Trumbull, Conn., and in the mica mines of Amelia County, Va.

CHLOROPHYCEAE, klô-rô-fî'sê-ê, a class of the lower plants commonly known as the green algae. The Chlorophyceae are especially characterized by their grass-green color, which is due to the abundance of chlorophyll (q.v.) present in chloroplasts (see **CHLOROPLAST**) in association with small quantities of carotene (orange) and xanthophyll (yellow) pigments. Starch is present as a result of photosynthetic activity, and oil may occur as a storage product.

Body Types.—The Chlorophyceae are repre-

sented by a wide range of body types. The simplest ones are single cells, which may be nonmotile (as in *Chlorella*), or motile either by flagella (as in *Chlamydomonas*) or by the secretion of mucilage (as in the desmids). Some organisms are composed of many cells arranged in loosely organized colonies (*Tetraspora*); other colonial forms (*Volvox*) have a more definite pattern of organization with some evidence of division of labor among the cells of a single colony. Still other Chlorophyceae are in the form of filaments (*Spirogyra*, *Stigeocolonium*), cylinders (*Enteromorpha*), or sheets (*Ulva*). Both uninucleate and multinucleate cells are found among the members of the Chlorophyceae. Nuclear division without subsequent division of the cell body has resulted, in some cases, in a tubular structure containing many nuclei and few, if any, septa. The tubes are often interwoven to form large plant bodies of striking appearance (*Penicillus*, *Caulerpa*).

Reproduction.—Asexual reproduction is accomplished by vegetative cell division or by the internal production of spores, which may be motile (zoospores) or nonmotile (aplanospores). Zoospores are commonly motile by means of two or four flagella of equal length inserted on the anterior end of the cell body; a few genera have zoospores with a crown of flagella. Sexual reproduction is widespread throughout the Chlorophyceae and is always effected through the union of two gametes. The gametes may be derived from the same parental strain (homothallism) or from different parental strains (heterothallism). The fusing gametes may both be motile and of equal size (isogamy) or unequal size (heterogamy), or one gamete may be motile and the other nonmotile (oögamy). Isogametes are often morphologically identical with zoospores and may function as asexual spores, if the opportunity for sexual fusion does not present itself. The complexity of the sexual process bears little relation to the type of plant body, inasmuch as all grades of sexual reproduction are found repeatedly in unicellular, colonial, and filamentous series. The nuclei of most Chlorophyceae (*Chlamydomonas*, *Spirogyra*) are haploid, the only diploid nucleus being in the zygote; some (especially the siphonaceous forms) are diploid, however, reduction in chromosome number occurring in the formation of gametes. In a few species (*Stigeocolonium*, *Cladophora subriana*) there is an alternation of a haploid, gamete-producing plant with a diploid, spore-producing plant.

Habitat.—The majority of the Chlorophyceae live in fresh water, but some (especially the siphonaceous forms) are marine. Many Chlorophyceae are common constituents of the soil flora, while others (notably *Protococcus*) are subaerial, occurring in such numbers as to color green the damp surfaces of tree trunks, stone, and brick and cement walls. Certain other Chlorophyceae form lichens in association with fungi.

Importance.—The Chlorophyceae are an important link in the natural food chain, supplying many microscopic animals with a source of food. Mass cultures of green algae are being investigated as a possible direct food source for cattle and other animals, and even for man. Scientific investigations in genetics, ecology, physiology, biophysics, and biochemistry have all profited in their use of the Chlorophyceae as research organisms. See also ALGAE.

G. M., *Fresh-water Algae of the United States*, 2d ed. (New York 1950).

RICHARD C. STARR,
Department of Botany, Indiana University.

CHLOROPHYLL is the green pigment by which plants mediate the process of photosynthesis (q.v.). It absorbs the light energy which is used in the reduction of carbon dioxide to sugars and other plant materials.

That chlorophyll is essential to photosynthesis can be shown in a number of simple ways. In the first place, the nongreen portions of variegated leaves and the nongreen leaves of variegated plants do not carry on photosynthesis. It is also possible to show that photosynthesis takes place within the cells of the leaf only when the light falls directly on the chlorophyll-containing bodies, the chloroplasts. Comparison of the absorption spectrum (the colors of light absorbed) of chlorophyll with the effectiveness of these colors in inducing photosynthesis by the leaf confirms the essentiality of chlorophyll to the photosynthetic process.

The chlorophyll of the plant cell is all contained in minute particles called grana, which are of the order of 1 micron in diameter, are disc shaped, and are formed in turn of successive thin layers. The component layers are made up of protein to which is attached chlorophyll and other substances, including the yellow carotenoids. Roughly 8 per cent of the dry weight of each granum is composed of chlorophyll, 50 per cent or more is protein, and the remainder is shared among a great variety of further constituents. In order to be effective in photosynthesis, the chlorophyll must be attached to the granum protein, and it is generally supposed that this protein contains other components essential to the photosynthetic process. The grana are associated together in chloroplasts, special bodies each containing 10-100 grana and each surrounded by a limiting membrane. Chloroplasts are of many different shapes and may be saucer-like, flat, granular, or spiral (see also CHLOROPLAST).

Chemically speaking, chlorophyll is a porphyrin, a structure composed of four simple pyrrole rings (each containing four carbon atoms and one nitrogen atom) joined through carbon bridges. It is distinguished from other porphyrins which occur in nature by (1) the magnesium atom which is bound in the center of the chlorophyll porphyrin ring, and (2) the long-chain phytol group which is bound to the porphyrin. Chlorophyll is characterized, too, by the number and nature of the simpler chains arranged around the periphery of the porphyrin nucleus. Higher plants (seed plants), in fact, ordinarily contain two chlorophylls, known as chlorophyll a and chlorophyll b, which differ from one another in the arrangement of their peripheral groups. Chlorophyll a, the more abundant form, possesses a CH_3 or methyl group, at a particular position at which chlorophyll b contains an aldehydic group.

The absorption spectrum of chlorophyll is characterized by a sharp peak in the blue region of the spectrum, between 4250 and 4750 angstroms. Chlorophyll possesses a second absorption maximum in the red end of the spectrum, a peak between 6500 and 7000 angstroms. Chlorophylls a and b may be distinguished by the small differences in their absorption spectra. The green color of chlorophyll is due to the fact that the chlorophyll molecule absorbs both red and blue,

but permits the green portion of the spectrum to pass through largely unabsorbed, and therefore visible to the eye.

J. F. BONNER,

Professor of Biology, California Institute of Technology.

CHLOROPHYLLITE, klō-rō-fil'it, an alteration product of the mineral iolite (q.v.). The only difference in composition is a larger percentage of water, but there is a marked decrease in hardness from the range of iolite of from 7 to 7.5 to that of chlorophyllite of from 1.5 to 3. There is also a difference in transparency. The characteristic blue color of iolite is changed to a dull green, and a basal cleavage is highly developed. Its specific gravity is 2.7. It is found at Unity, N. H.

CHLOROPICRIN, klō-rō-pīk'rīn, a heavy, colorless, pungent-smelling liquid, obtained by subjecting picric acid (q.v.) to the action of chlorine; hence it is also called nitrochloroform. Its vapor causes vomiting; thus it is sometimes called vomiting gas. Its vapor also irritates the eyes. Its chemical formula is CCl_3NO_2 . It is readily soluble in alcohol but not in water. High concentrations of the gas used in warfare have caused death.

CHLOROPLAST, klō-rō-plāst. The chlorophyll (q.v.) or green coloring matter of plant cells is not diffused throughout their mass, but is collected in certain special bodies known as *chloroplasts*. These chloroplasts may be of the most varied shapes; they may be granular, as is the case in most flowering plants, or spiral bands, as in *Spirogyra*, or flat plates, as in *Mesocarpus*. They contain particles of nutritive material in the form of starch-grains, oil-drops, and highly-refractive masses of proteid known as *pyrenoids*.

Bodies of the same general character as chloroplasts, but differing from them in the absence of chlorophyll, are known as *leucoplasts* or *chromoplasts* according as they are colorless or pigmented. Chloroplasts, leucoplasts and chromoplasts are all known as *chromatophores*. In all embryonal cells, all the chromatophores have the appearance of leucoplasts, being small, transparent, highly-refractive bodies of granular, spindle-like, or thread-like form. It is because of this common origin that the chromatophores, or as they are also called, *plastids*, are classed together under a single heading.

In those phanerogams that lack a green color, the chloroplasts are replaced by other chromatophores. In the fungi, however, which likewise lack chlorophyll, there are no chromatophores of any sort. The chromatophores of the blue-green, red and brown algae contain chlorophyll, but in addition other pigments, known as phycocyan in the blue-green algae, phycoerythrin in the red algae, and fucoxanthin in the brown algae.

The chloroplast, as the chlorophyll-bearing organ, is undoubtedly that part of the cell which is most directly concerned in the assimilation of carbon dioxide. This process is very imperfectly understood, but is believed to involve the action of an enzyme. (See CHLOROPHYLL).

Ponomarew claims that the chloroplast is liquid, and of a colloidal nature. He explains its relative permanency of shape by supposing that it is in equilibrium with the surrounding

cell-contents as to surface-tension. He accounts for the contraction of the chloroplast into a spherical shape when the cell is treated with dilute alcohol as due to a disturbance of this equilibrium.

In most plants the chloroplasts are sensitive to light, and place themselves in the cell in such a manner as to offer the greatest surface possible to a slight illumination, but the least surface possible to an intense illumination. Thus the plate-like chloroplast of *Mesocarpus* presents its face to a weak light, its edge to a strong one. The chloroplasts of *Lemna trisulca* group themselves in planes parallel to the surface of the leaf when moderately illuminated, but perpendicular thereto if the illumination be intense. In all cases the position in the dark is less definitely determined. On account of these light-reactions of the chloroplasts, the suggestion has been made that they act in a manner analogous to sense-organs, but this idea of a specific sensitivity on their part was opposed by Pfeffer.

CHLOROSIS, klō-rō'sīs, is not now regarded as a separate disease but rather as a normal tendency toward anemia in adolescent girls due to rapid growth and food deficiencies. First described by Johann Lange (1485-1565) of Basel in 1554, it was given its name *De morbo virgineo*, or sickness of young girls. Its existence was recognized as extremely common in girls' boarding schools and among domestic servants. As early as 1837 it was known to be associated with a deficiency of iron in the blood. Chlorosis is observed in young women between the age of puberty and twenty-five. It is characterized by anemia, usually with a lowered red blood cell count, the cells being considerably reduced in size, as a rule, and with an extremely low hemoglobin content. The cells themselves, in stained specimens, appear as rings. Persons affected exhibit a greenish pallor, especially about the eyes and chin, from which the disease receives its name, "green sickness." There are also present the usual signs of severe anemia such as breathlessness, irritability, and edema of the ankles, as well as digestive disturbances, capricious appetite, constipation, and lessened menstrual flow. It is thought that in former years many cases of duodenal ulcer and early tuberculosis in anemic young women were classed as chlorosis. The malady has all but disappeared and only occasional cases have been reported in recent years. As a clinical entity chlorosis is no longer of importance.

HAROLD WELLINGTON JONES, M.D.

CHLOROXYLON, a genus of plants of the family Meliaceae, distinguished by the fact that the fruit has only three cells and is split into three parts. The satinwood tree of India, *Chloroxylon swietenia*, sometimes grows to a height of 50 or 60 feet and is a native of Ceylon and the Coromandel coast. The wood is hard and light-colored, having a satin-like luster and is sometimes cotted or curled, somewhat resembling boxwood but deeper in color. It is mainly used for articles of turnery and cabinetwork.

CHLORTETRACYCLINE. See ANTI-BIOTICS.

CHMEL, kměl, Joseph, Austrian historian: b. Olmütz, March 18, 1798; d. Vienna, Nov. 28,

1858. In 1846 he was appointed vice director of the Vienna State Archives. He edited the following works: *Regesta chronologico-diplomatica Rupertii regis Romanorum* (Frankfurt am Main 1834); *Die Handschriften der kaiserlich-königlichen Hofbibliothek in Wien*, 2 vols. (Vienna 1840-41); *Urkunden, Briefe und Aktenstücke zur Geschichte Maximilians und seiner Zeit* (Stuttgart 1845); *Aktenstücke und Briefe zur Geschichte des Hauses Habsburg im Zeitalter Maximilians I, Monumenta Habsburgica*, vol. 1 (Vienna 1854); *Regesta chronologico-diplomatica Friderici III*, 2 vols. (Vienna 1859).

CHMELNIZKIJ, kmél-nít'skê, **Nikolai Ivanovich**, Russian playwright: b. 1789; d. St. Petersburg, 1845. He contributed largely to the reformation and elevation of the Russian stage. His works include *The Word of the Tsar*; *Russian Faust*; *The Babblers*; *Air Castles*; *The Waverer*. He translated Molière's *Tartuffe* and *School of Women*.

CHMIELNICKI, kmyél-nêts'kê, **Bogdan**, Cossack chief: b. 1593; d. Aug. 25, 1657. He was the son of a Polish nobleman, who settled among the Cossacks of the Ukraine. This people, who had long defended the eastern boundaries of Poland against the Tatars and Russians, were at that time subjected to grievous oppression. Their religion was persecuted, their freedom circumscribed and the castle of Kudak, called the curb of the Cossacks, was built to restrain them. Thus exasperated, they seized Kudak and massacred the garrison, but were soon subdued. After their defeat at Kumejki, Bogdan was sent to the Polish court, where he was favorably received, but suspicion soon drove him forth and finally made him a scourge of Poland. Availing himself of the hatred and prejudices of the Cossacks, he entered upon a conspiracy against the Poles, and sought the alliance of the khan of the Tatars. Chmielnicki became master of the Ukraine and carried terror, devastation, and death as far as Lemberg and Zamosc. Under the new king, John Casimir, the war was continued with equal ferocity on both sides until Chmielnicki was checked in 1651. He sought the protection of Turkey, of Russia (1654), and again that of Poland (1656), and finally lived in retirement under the suzerainty of the Czar of Russia. An equestrian statue commemorating Chmielnicki was erected at Kiev in 1873.

CHMIELOWSKI, kmyê-lôf'skê, **Piotr**, Polish writer: b. Podolia, 1848; d. Lwow, April 22, 1904. He was educated at the universities of Warsaw and Leipzig. Lecturing at the University of Warsaw on the history of Polish literature in 1880, he gave up the course when asked to speak in Russian rather than in Polish. He then devoted himself to editing the monthly literary review, *Ateneum*, which he published from 1881 to 1897, and to other literary endeavors. He did much to promote the culture of Poland. His works include *Goethe* (1878); *Rousseau* (1878); *Liberalizm i obskurantyzm* (1882); *Autorkipolski* (1885); *Adam Mickiewicz*, 2 vols. (1886); *Józef Ignacy Krasiński* (1886); *Studia i szkice* (1886); *Nasza Literatura Dramatyczna*, 2 vols. (1898).

CHOATE, chôt, **Joseph Hodges**, American lawyer and diplomat: b. Salem, Mass., Jan. 24,

1832; d. New York City, May 14, 1917. He was graduated from Harvard University in 1852 and from the Harvard Law School two years later. After practicing law in Boston for a year he went to New York City, where he achieved remarkable success as a lawyer. In 1856 he became active as a Republican in support of John C. Frémont. In 1884 he became a member of the famous legal firm of Evarts, Choate and Southmayd. He won great distinction as a trial lawyer, conducting many celebrated cases in state and federal courts, and international tribunals. He successfully defended Gen. Fitz-John Porter, prosecuted the infamous Tweed Ring, appeared in the Samuel J. Tilden will contest, the Chinese exclusion cases, and the income tax cases of 1894. In 1894 he was president of the New York Constitutional Convention. In 1897 he was a candidate for the United States Senate, but was defeated by Thomas C. Platt. President McKinley appointed him in 1899 to succeed John Hay as ambassador to the Court of Saint James', in which capacity he served with distinction till 1905. He was elected Benchman of the Middle Temple of London on April 10, 1905. In 1907 he served as ambassador and leading delegate of the United States to the International Peace Conference at The Hague, and his activity as a public-spirited citizen was manifested as a trustee of the Metropolitan Museum of Art and of the American Museum of Natural History, a governor of the New York Hospital (1877-1917) and in many other ways. His works include *Abraham Lincoln, and Other Addresses in England* (1910); *American Addresses* (1911); *The Two Hague Conferences* (1913).

Consult Strong, T. G., *Joseph H. Choate: New Englander, New Yorker, Lawyer, Ambassador* (New York 1917); Martin, E. S., *Life of Joseph H. Choate*, 2 vols. (New York 1920).

CHOATE, Rufus, American lawyer: b. Essex, Mass., Oct. 1, 1799; d. Halifax, N. S., July 13, 1859. As a child he showed remarkable precocity; was graduated from Dartmouth College in 1819; was admitted to the bar and began practice in Danvers in 1822; removed to Salem in 1828; and was a member of Congress in 1831-1833, resigning in the latter year. Moving to Boston in 1834, he rapidly acquired a large practice. He was successor of Daniel Webster in the United States Senate in 1841-1845; he resumed his legal practice in Boston at the expiration of his senatorial term. He traveled in Europe in 1850 and was a delegate to the Whig National Convention in Baltimore in 1852. After Webster's death Mr. Choate was acknowledged the leader of the Massachusetts bar. He made many political speeches, the most brilliant, while a United States senator, including those on the Oregon Boundary, the Tariff, the Fiscal Bank Bill, the Smithsonian Institution, and the Annexation of Texas. His style is peculiar and characteristic, but hardly to be commended as a model for imitation; it is rich, vivid, and glowing, instinct with passion and colored with all the hues of fancy, but sometimes, it must be admitted, a little extravagant and exaggerated. The most remarkable feature, however, in his written compositions, is the structure of his periods. These are not the short and compact statements, involving but a single proposition, in which modern writers of our times express their thoughts; they recall and renew the continuous sweep and long-resounding march of the prose writers of the

16th century. They are often of breathless length, containing clause after clause, modifying, enlarging, or limiting the leading idea.

Consult Brown, Samuel G., *The Works of Rufus Chabote, with a Memoir of His Life*, 2 vols. (Boston 1862); Fuess, Claude M., *Rufus Choate, the Wizard of the Law* (New York 1928).

CHOCANO, chò-kä'nò, José Santos, Peruvian poet: b. May 14, 1875; d. Santiago de Chile, Dec. 13, 1934. His early years are obscure. He was an active journalist, diplomat, and revolutionary politician, and spent some years in Colombia, Spain, Mexico, and Guatemala. He was an adviser to both Francisco Villa and Manuel Estreba Cabrera. Not long after he had returned to Peru in 1921, he killed one of his political enemies. Thereafter he lived in exile in Chile, where he was himself murdered. His poetry speaks out of both Indian and Spanish traditions, and defends Latin America against what he viewed as imperialism from the north. Although it sometimes fails to rise above rhetoric, it is generally rich, vigorous, and musical. The best-known of his volumes, *Alma América* (1906) influenced Rubén Darío in the development of American themes. His other works include *Iras santas* (1894), *Fiat Lux!* (1908), and *Primitias de oro de Indias* (1934).

CHOCOLATE and COCOA. See CACAO.

CHOCOLATE SOLDIER, The, an opera by Oskar Straus (1870-1954), first performed in Vienna in 1908 as *Der Tappere Soldat*. The work was first performed in the United States at New York City on Sept. 13, 1909. Among light musical productions of that era it is unusual for its freedom from sentimentalness. It is based on George Bernard Shaw's play *Arms and the Man*, and supports its story with music that is buoyant and melodious. Its best-known song is *My Hero*.

CHOCTAW, an American Indian tribe of Muskogean stock, closely related to the Chickasaw. The Choctaws' original homeland during historic times was central and southern Mississippi and southwestern Alabama. They were an agricultural people, raising corn, beans, and pumpkins for food and export to other tribes; and the most commercial minded of all the southern Indians. Apparently they were less interested in ceremonials than their neighbors, as noted for their songs and dances, which were more recreational than religious. They were a peaceable people, but fought bravely in defense of their homeland.

The tribe had three (possibly, in early times, four) geographical divisions, with somewhat different customs and dialects. Each had its head chief and council; and councils of the whole nation were called by the three chiefs acting in concert. Local government was managed by town officials and councils, though in historic times the "town" was a scattered agricultural settlement. The whole nation was divided into two phratries, within which marriage was prohibited. These were subdivided into clans, which were of fundamental significance in the social organization. Descent was from the female line. The Choctaws had a tradition that they and the Chickasaws had migrated as one people from a distant western land, and had become separated during the journey. They also had a

conflicting creation myth that they had originated at a great fortified mound on their northern frontier in Mississippi. They were first seen by Europeans when Hernando de Soto crossed their country in 1540.

From about 1700 the French in Louisiana, the Spanish in Florida, and the English along the Atlantic carried on complicated intrigues for their friendship and trade. In general they favored the French, though in the 1740's the tribe was torn by civil war between French and English adherents. In the Revolutionary War Choctaws served as scouts in the American Army; and in 1786 by the Treaty of Hopewell they recognized the sovereignty of the United States. Their warriors joined the Americans against the British and hostile Creeks in the War of 1812.

During this period the Choctaws learned to plant European fruits and garden vegetables; to raise livestock and barnyard fowls; and to grow, spin, and weave cotton for their clothing. At the same time several white men of ability and character settled among them and married Choctaw women; and their sons became leaders of progress within the tribe. In 1818 in response to an urgent appeal from the Choctaws, Christian missionaries began religious and educational work in their country. Then the tribe began to enact laws by rudimentary constitutional processes and reduce them to writing. Some of their leaders acquired Negro slaves and operated plantations.

But the white frontier advanced upon them; and in a series of treaties from 1801 to 1830 they surrendered their homeland and agreed to remove to a wild land comprising the southern half of Oklahoma. A census made just before they started showed a population of 19,554, including 97 intermarried whites and 248 Negro slaves. Of these, about 1,500 remained in Mississippi under a clause of the removal treaty by which they could select allotments of land and become United States citizens; but this provision was not fulfilled, and they sank into poverty. The main emigration took place during 1831-1833. An appalling number died; in 1843 a careful estimate set their population at 12,690. After that, it remained stationary; a census taken in 1885 listed 12,816 Indians, but the number of intermarried whites had increased to 427.

The Choctaws made remarkable progress in the new land. They established a constitutional government. They maintained a comprehensive school system. Their settlements were dotted with Presbyterian, Methodist, and Baptist churches, usually served by native pastors, often college trained. They laid out fields, planted orchards, accumulated live stock. The land belonged to the tribe, but each citizen was protected in the use of all he cared to cultivate. In 1837 the Chickasaws purchased the right to join them, but became dissatisfied, and under a treaty made in 1855 set up an independent government over their own district, which lay west of the Choctaw. The two tribes continued to own the land jointly; hence from this time on they negotiated all treaties together.

In the Civil War the Choctaws and Chickasaws joined the South. Their men served in the Confederate Army and they sent a delegate to the Confederate Congress. After the war when they resumed treaty relations with the United States, they were required to surrender an unsettled tract of land west of the Chickasaw district. They were given the option of adopting

their freedmen and receiving \$300,000 for the ceded land, or letting the United States remove the Negroes and expend the money for them. Both tribes requested the removal, but the government failed to act. Finally in 1885 the Choctaws gave their freedmen limited citizenship and property rights; and received their portion of the \$300,000.

In the westward movement following the Civil War the white frontier again reached the Choctaws. The first railroad was built across their country in 1872; and white city builders flocked to the stations. Extensive coal mines were leased to white operators and worked by white laborers. All this was regulated by the tribal government, which collected a royalty on the coal, a tax on the business, and a permit fee for the laborers; but many intruders filtered in illegally. The first federal census—made in 1890—showed a white population outnumbering the Choctaw almost three to one.

The United States then determined to abolish the tribal regime. The land was divided up into individual allotments, the tribal government was dissolved, and the Indians were given United States citizenship. When Oklahoma became a state in 1907, the Choctaws became a part of the general population. Their number is unknown. The allotment roll, totaling 26,828, is carried in Bureau of Indian Affairs statistics, but this roll, besides including 1,651 white and 6,029 Negro allottees, is the sum of those living on Sept. 25, 1902, the children born after that date and living on March 4, 1905, and the infants born after the second enumeration and living on March 4, 1906. At the time of allotment, 1,660 Choctaws were brought from Mississippi to share in the division of property; but many of them returned. In 1944 the number in Mississippi was 2,232—living near Philadelphia, in Neshoba County. In Oklahoma the Choctaws are distributed throughout the state—many are among its leading citizens—but fullblood settlements still exist in the southeastern portion. See also CHICKASAW.

ANGIE DEBO,

Author of "The Rise and Fall of the Choctaw Republic" and "And Still the Waters Run."

CHODAT, shō-dä', Robert Hippolyte, Swiss botanist: b. Moutier-Grandval, Bern canton, April 6, 1865. In 1890 he became a professor of botany at the University of Geneva, and was dean of the Faculty of Sciences there from 1898 to 1906, and rector of the university from 1908 to 1910. Besides numerous professional papers in botanical journals, he published important monographs.

CHODKIEWICZ, kôt-kyě'vèch, Jan Karol, Polish general: b. Lithuania, 1560; d. Khotin, Oct. 24, 1621. He served in the Spanish army under the duke of Alva and also under Maurice of Nassau. In 1596 he distinguished himself in the campaign against the Cossacks and in 1600 in the expedition of Jan Zamojski against the Turks. In 1602 he went to Livonia as commander of the Polish army, and three years later he inflicted a crushing defeat on Charles IX of Sweden at the Battle of Kirchholm. He made an unsuccessful campaign against Russia, and before his death won a decisive victory over the Turks at Khotin.

CHODOWIECKI, kô-dô-vyěts'kê, Daniel Nikolaus, German painter and engraver: b. Dan-

zig, Poland, Oct. 16, 1726; d. Berlin, Feb. 7, 1801. He worked first in business in Danzig and, after 1743, in Berlin. In 1754 he turned to painting. He painted snuff boxes, worked at enamel-painting, and did miniatures. The Academy of Art of Berlin commissioned him to make designs for its almanac; the result, a set of miniatures depicting the life of Jesus Christ, established his reputation. Thenceforth he worked chiefly as an engraver. After 1757 he executed more than 2,000 engravings, the vast majority of which appeared as book illustrations. Besides illustrating first editions of works by Gotthold Ephraim Lessing, Johann Wolfgang von Goethe, Johann Christoph Friedrich von Schiller, and Friedrich Gottlieb Klopstock, he did illustrations for *Don Quixote*, the works of Shakespeare and Voltaire, Oliver Goldsmith's *The Vicar of Wakefield*, and many other works. In design and execution he was a master craftsman. His painting depicting Jean Calas and his family is well-known. He became director of the Academy of Arts in 1797.

CHODZKO, kôj'kô, Aleksander, Polish Russian writer and scholar: b. Krivichi (Krywicze), Russia, July 11, 1804?; d. France, Dec. 20, 1891. He served for a while as a Russian consul in Persia. From 1858 to 1894 he was professor of Slavic languages and literature at the Collège de France in Paris. His works include *Le Théâtre en Perse* (1845), *Grammaire persane* (1852), *Légendes slaves du moyen-âge* (1859) and *Grammaire paléoslave* (1869).

CHODZKO, Leonard Jakób, Polish scholar b. Oborek, Lithuania, Nov. 6, 1800; d. Poitiers Department of Vienne, France, March 12, 1871. Having traveled as secretary of Michał Kleofa Ogiński through nearly all of Europe, he established himself in 1826 at Paris, where he published a memoir of Ogiński, with an introduction entitled "Observations sur la Pologne et les polonais" (1827). He later published *Histoire des légions polonaises en Italie* (1829). During the revolution of July 1830, he served as adjutant to the marquis de Lafayette; and after the outbreak of November 29 of the same year in Warsaw, he acted as agent of the revolutionary government in France. The most important of his writings was *La Pologne historique, littéraire, monumentale et pittoresque*, 3 vols. (1835-1837).

CHOENIX, kê'nîks, a dry measure of capacity among the ancient Greeks. It was used particularly for grain, and is said to have been the normal daily ration of a man. Its size differed at various times and in various parts of the Greek world. Some accounts represent it as containing three cotulae, or about 1.487 pints English; others make it equal to 1.982 pints; and still others give it as equal to 3.964 pints. Scholars now generally suppose it to have been equal to about 1 quart in the Anglo-American scale of dry measure.

CHOERILUS, kêr'i-lüs, the name of several Greek poets. **CHOERILUS OF ATHENS** (fl. 6th-5th cent. B.C.) was a tragic poet. According to Suidas, he began writing plays in 523 B.C. and competed as a playwright with Aeschylus and Pratinas. He is said to have effected changes in the tragic mask and costume. Of his tragedies none survives and the name of only one, the *Alope*, is known. **CHOERILUS OF SAMOS** (fl. late 5th cent. B.C.) composed an epic poem, *Perseis*, celebrating

victory of the Greeks over Xerxes I. He was a friend of Herodotus, and, according to Suidas fled Samos after him. Later, he celebrated the feats of Lysander. He died at the court of Archelaus of Macedonia. *Perseis* is notable for its celebration of an historical rather than a mythological subject. The fragments still extant were collected and explained by A. F. Näke (1817). CHOERILUS OF IASOS (fl. 4th cent. B.C.) was also an epic poet. He was among those who accompanied Alexander the Great on his expedition to the East. Horace mentions him in his *Epistles* as an example of an extremely bad poet.

CHOIR. *In religious worship*, an organized body of singers. In ceremonial Christian religions, the choir officials and choristers, or other singers taken collectively, are spoken of as the choir. Typical choral organizations in cathedrals and churches of the Church of England are usually divided into two sets of voices, the one sitting on the north and the other on the south side of the chancel, and are known by the respective titles of cantoris and decani from their nearness to the cantor, or precentor, and to the decanus, or dean. In most cathedrals and collegiate churches, the decani side is held to be the side of honor, the best voices are placed there, and all the verses or solo parts, if not otherwise directed, are sung by that side, which is also considered the "first choir" (*coro primo*) in eight-part music. In Roman Catholic churches the choir is customarily assigned to a gallery at the opposite end of the church from the main altar, or to a similarly conspicuous place.

In architecture, that part of a church designed for the stalls of the clergy and choir. A bench for the clergy, with the bishop's throne in the center, surrounded the semicircular apse of early Christian basilicas. The nave allotted to the laity was much larger than the space reserved for the clergy, but as the latter including the choristers grew in numbers, the apse could not accommodate them. Therefore, in certain later basilicas, such as San Clemente, Rome, the clergy overflowed into the nave and were screened from the congregation by a low wall. With the growth of monasticism in the later middle ages, more definite removal of the monks or canons from the laity became desirable. Indeed many offices were celebrated for the clergy alone, and the laity had their own separate services in the nave. Hence, an additional unit, the choir, was inserted in front of the sanctuary and was often separated from the laity by a choir screen. Where this was inadequate, the choir might encroach on the nave and the choir screen be located there, as for example, in Westminster Abbey, London. This is confusing; the *architectural choir* lies between the sanctuary or chancel and the crossing, while the *ritual choir* is the space assigned to the choir stalls. Hence the ritual choir may include not only the architectural choir but the crossing and part of the nave. Further confusion results from applying the term, choir loosely to refer to the entire eastern end of the church.

The width of the choir is determined by the number of rows of choir stalls required, and its length by the number of stalls in each row. If two rows of stalls on either side flanked the central aisle, about 28 feet sufficed; three such rows occupied about 42 feet. The architectural choir tended to determine the width of the chancel and north

of the church. Hence in churches served by monks or canons—and most of the greater churches particularly in England were of this class—the choir determined the church. Generally during the middle ages the sanctuary and choir were built first, followed by the nave. In the Cathedral of St. John the Divine, New York City, the first service in the choir and crossing was held in 1911; the first in the completed nave in 1941. However, as the fortunes of a diocese improved, it often replaced its venerable sanctuary and choir but not its nave. Thus at Beauvais, France, the nave, called the *basse oeuvre*, is centuries older than the Gothic apse, choir, and transepts; at Gloucester and Ely, England, 12th century naves lead up to 13th or 14th century choirs.

EVERARD M. UPJOHN,
Professor of Fine Arts, Columbia University.

CHOIR INVISIBLE, The, a novel by James Lane Allen, first published as *John Gray* in 1893, and enlarged and republished under its present title in 1897. Its scene is late 18th century Kentucky, and the descriptions of pioneer life give it historical value.

CHOISEUL, shwá'zúl', Duc César de French soldier: b. Paris, Feb. 12, 1598; d. there Dec. 23, 1675. He participated in the siege of La Rochelle, made a successful defense of the Île d'Oléron against the English, and beat them back at the Île de Ré. From 1630 to 1635 he was French ambassador at the court of Savoy. He later played a distinguished part in the Italian and Spanish campaigns. In the first outbreak of the Fronde he led in besieging Paris (1649); in the second outbreak he won over the Vicomte de Turenne and the Spanish at Rethel (1650). He became a marshal of France in 1645, minister of state in 1652, and a duke in 1665. During much of his life he was known as the Sieur du Plessis-Graslin.

CHOISEUL, Duc Étienne François

(early life COMTE DE STAINVILLE), French statesman: b. June 28, 1719; d. Paris, May 8, 1785. Entering the army in early life, he distinguished himself in the War of the Austrian Succession and served afterwards in the Low Countries, 1748. His marriage in 1750 with a member of the Crozat family gave him the command of great wealth, and his intimacy with Mme. de Pompadour furnished the means of gratifying his ambition; as he gratified hers by the expulsion of the Jesuits, whom he had come to regard as much as she did. As ambassador to Russia from 1754 to 1757 he obtained from Pope Benedict XIV the celebrated encyclical letter intended to appease the disputes which had arisen on the bull Unigenitus. While ambassador to Austria in 1757–1758, he concluded with Marie Thérèse a treaty of alliance against Prussia. He became minister of foreign affairs and was made a duke in 1758, and from 1761 to 1766 he served as minister of war and minister of the navy. His administration was marked by many reforms. He organized and revitalized the army and negotiated the Family Compact, reuniting various members of the Bourbon family; restored Lorraine and Corsica to France; pursued a hostile policy toward England and his failure to provide for adequate defense of the North American colonies led, in the Paris Peace Treaty (1763), to results unfortunate for France.

controlled French policy until 1770, when his fall was brought about by Mme. du Barry, the king's new favorite. The total suppression of the Jesuits by Pope Clement XIV came after his fall, but it was partly due to negotiations which he had initiated on behalf of the Bourbon kings. He was recalled to court on the accession of Louis XVI in 1774, but was not again entrusted with power.

CHOISEUL, shwá'zúl', island, Solomon Islands, southwest Pacific. One of the three main northern islands of the Solomon archipelago, it is located about midway between Bougainville and Santa Isabel islands. It is 90 miles long and, at its broadest point, 20 miles wide. The island is volcanic, and reaches an elevation of 2,470 feet. The inhabitants produce copra. Choiseul was controlled by Germany from 1886 to 1899, when it passed to the British. The Japanese occupied it in 1942-1943.

CHOISEUL-GOUFFIER, gōō-fě'ā, COMTE de (full name MARIE GABRIEL FLORENT AUGUSTE de CHOISEUL-GOUFFIER), French antiquarian and diplomat: b. Paris, Sept. 27, 1752; d. Aachen, Germany, June 20, 1817. He visited Greece in 1776. The result was his principal work, *Voyage pittoresque de la Grèce* (1780-1824). He was elected to the Académie Française in 1783. From 1784 to 1791 he was French ambassador at Constantinople. After his return to France in 1802, he was named minister of state. His valuable collection of antiquities is now in the Louvre museum.

CHOISEUL-PRASLIN, prā-lān, COMTE de (full name EUGÈNE ANTOINE HORACE CHOISEUL-PRASLIN), French statesman: b. Paris, Feb. 23, 1837; d. there, Dec. 6, 1915. In 1869 he was elected to the Corps Législatif and in 1871 to the National Assembly. He was minister plenipotentiary to Italy in 1871. In 1880 he became secretary of state in the ministry of foreign affairs, under the premiership of Jules François Camille Ferry. He was regarded as very influential in the Republican majority.

CHOISY, shwá'zé', François Auguste, French civil engineer and historian of architecture: b. Vitry-le-François, Department of Marne, 1841; d. 1909. He was chief civil engineer and professor of architecture at L'École des Ponts et Chaussées in Paris. His most notable book is *Histoire de l'architecture* (1899), an exhaustive treatment of the evolution of structural and decorative forms. Among his other works are *L'art de bâtir chez les Romains* (1873); and *L'art de bâtir chez les Égyptiens* (1904).

CHOISY, ABBÉ François Timoleon de, French ecclesiastic and author: b. Paris, Aug. 16, 1644; d. there, Oct. 2, 1724. He was the son of the secretary to Gaston Jean Baptiste d'Orleans, brother to Louis XIII, and among members of the court early acquired notoriety for his wearing of feminine dress and his taste for intrigue. In 1683, following a serious illness, he turned to religion, and in 1685 he went on a mission to Siam. He became a priest in 1686. His many writings include both *Histoire de madame la comtesse des Barres* (1735), an account of the life he experienced in feminine guise, and serious works such as *Histoire de l'Église depuis la naissance*

du Christianisme jusqu'à la fin du règne de Louis XIV (1703-1723). The work for which he is remembered, however, is his undated *Mémoires*, which, though often inexact in historical detail, contains invaluable portraits of contemporaries.

CHOISY-LE-ROI, shwá'zé'lě-rwā', commune, department of Seine, France. It is located seven miles south of Paris, on the left bank of the Seine. Anne Marie Louise d'Orleans, Duchesse de Montpensier, built a pleasure chateau here in 1682 which was later acquired by Louis XV as a residence. It was destroyed during the revolution, but ruins remain. Claude Joseph Rouget de Lisle, composer of the *Marseillaise*, is buried in the town cemetery. Choisy-le-Roi was the site of a battle between the French and the Prussians on Nov. 30, 1870. There is varied manufacturing. Pop. (1946) 27,333.

CHOISYA, a small genus of four or five species of shrubs in southern North America belonging to the rue family (Rutaceae). One species, *Choisya ternata*, the Mexican orange, is cultivated in the warmer parts of the United States and sometimes in greenhouses for its fragrant, orange-like flowers.

CHOKEBERRY, the name given to *Aronia*, a small shrub of eastern North America. It is indigenous to swamps, but is cultivated as an ornamental shrub. The leaves are serrate and glossy; the flowers, generally white. The red chokeberry, *Aronia arbutifolia*, is an erect shrub growing as high as 10 feet. The purple chokeberry, *Aronia prunifolia*, closely resembles it. The black chokeberry, *Aronia melanocarpa*, is a low shrub of 4 feet or under, and differs also from the other two in having leaves which are smooth beneath.

CHOKECHERRY, the common name of *Prunus virginiana*, a large shrub or small tree native to North America. It is found most often on river banks or in rocky situations, and is thicket-forming. Its white flowers form fruits which deepen in color as they mature from red to purplish-black. The western chokecherry, *Prunus demissa*, is similar. The closely related black or rum-cherry, *Prunus serotina*, is valuable for its wood. Its aromatic bark distinguishes it from the chokecherry.

CHOKEDAMP or **BLACKDAMP**, a gas found mainly in old or unventilated mines. It is heavier than air, and consists chiefly of carbon dioxide, though it also contains a small, variable proportion of nitrogen. It supports neither life nor flame. With a drop in atmospheric pressure the gas may emerge into mines being worked. A product of natural oxidation, it is found also in caves and wells.

CHOKING, a stoppage caused by the passage of fumes, a gas, or a solid substance into the larynx or upper opening of the trachea, or by an obstruction of the esophagus itself. It is usually followed by a violent fit of coughing which lasts, in slight cases, until the offending substance is expelled. Sometimes, however, a larger mass of solid substance is drawn into the opening of the trachea, completely blocking it, and arresting respiration altogether. This condition is one of ex-

tre danger; the sufferer becomes purple in the face, and if not at once relieved will die of suffocation. The obstructing substance may often be dislodged by means of the fingers. A child may sometimes be saved by holding it up by the heels and shaking it, or slapping its back. If these measures fail, an emergency surgical opening of the trachea may be effected in order to admit air below the obstruction and thus prevent death. In the case of an animal, the obstruction may often be removed by means of the hand, or, through the administration of water, oil, or belladonna solution, the animal may be forced to swallow the obstructing substance. Sometimes the substance may be pushed down by means of a probang. In some cases it is necessary to resort to surgery.

CHOLA, chō'lā, an ancient Tamil kingdom, southern India. Located in what is now the state of Madras, it comprised the area extending north from Pudokkotai to Nellore. It existed from the 4th century B.C. During the period 907-1310 A.D. it held supremacy in southern India. It ruled over Ceylon in the first half of the 11th century. A Moslem invasion destroyed the kingdom. Tanjore, which was its principal capital, still contains the kingdom's chief architectural monument, an 11th-century temple.

CHOLECYSTOGRAPHY, kōl-ê-sis-tōg'-rā-fi, a method of depicting a test of the concentrating ability of the gall bladder. A dye (tetraiodophenolphthalein) is administered, usually by mouth and on an empty stomach. After several hours X-ray films are made of the gall bladder, first in the absence of any food in the digestive tract and later following the taking of a certain quantity of fat such as cream. The interpretation rests on the determination of the amount of variation from the normal density of the gall bladder shadow. Data concerning the degree of remaining function are said to be reliable in more than 95 per cent of cases. In many cases stones will be visualized in plain films but not always, even in gall bladders which contain a large number.

HAROLD W. JONES, M.D.

CHOLERA, kōl'ēr-ā, (**CHOLERA ASIATICA**; **CHOLERA INDICA**), an acute, specific, infectious, and contagious disease affecting especially the terminal ileum of the small intestine. It is caused by the *Vibrio cholerae*, the so-called comma bacillus. The causal organism is a small, curved, motile, gram-negative bacillus having a flagellum at one end. The disease is confined entirely to man and the bacillus finds its way into the body through the mouth, by way of contaminated food or drink. The greatest single source of infection is a contaminated water supply, as exemplified especially, by serious epidemics occurring in cities near the river Ganges in India throughout many centuries and, in the latter part of the 19th century, in Hamburg, Germany. The organism can persist in water for as long as 7 days. Other sources are through insect carriers, such as roaches and flies, which convey the bacilli from human feces to food.

History.—Cholera has a long history and is said to have originated in the Far East, perhaps thousands of years ago. Sanskrit writings indicate that it existed many centuries before the Christian era. It was first described

adequately, however, in comparatively modern times in the year 1563, by Garcia del Huerto (1490-1570), a Portuguese physician at Goa, India. The mode of communication by infected water was first demonstrated in 1849 by John Snow (1813-1858), a well known physician of London. Robert Koch of Berlin (1843-1910) discovered the bacillus of cholera in 1884. Serious epidemics of the disease occurred in the 17th and 18th centuries but these were confined to Asiatic countries. The great pandemics of 1826 to 1837 resulted in cholera's spreading to Europe for the first time. Eventually it reached Marseilles, from the Eastern countries, and from there it spread to Paris. In the United States it was first observed about 1832 and was in epidemic form in 1835, 1836, 1849, 1854, 1867, 1873, and 1884. The last epidemic was in 1893 but it had not assumed serious proportions since 1873, when it ceased to be a menace. In the Philippine Islands it has existed in sporadic form during the present century. The last epidemic of any size was in 1911.

Etiology.—True Asiatic cholera is caused only by the *Vibrio* and no disease of other origin, no matter what the symptoms, may be called cholera. Thus cholera infantum, once applied indiscriminately to acute diarrhea in infants, is misnamed, as it is actually caused by the invasion by bacilli of dysentery. The same is true of acute enteritis in adults, sometimes referred to as cholera morbus. (See **DYSENTERY**.) The disease hog cholera is caused by *Salmonella cholerae* and, although the name has persisted, this is not a true cholera which never exists in animals.

Symptomatology.—The incubation stage varies from a few hours to about 5 days, the average being 3 days. The onset of cholera is abrupt, with terrific purging, so that there is practically no control over the action of the bowels. This makes the disease the more dangerous since the dejecta of a cholera patient, unless disposed of promptly, are effective in spreading the disease. Within a few hours vomiting is apt to ensue, accompanied by violent muscular cramps and great prostration. The stools at first contain fecal matter which is soon changed to the characteristic "rice water" evacuations containing only flakes of mucus. In severe forms of the disease there is suppression of urine and extreme dehydration. The body shrinks to a fantastic degree, the skin is dry and wrinkled, as are all mucous membranes. The face becomes pinched, the eyes are sunken, the limbs cold and cyanotic, with all the appearances of impending death. The patient is restless but realizes his condition, for his mind is usually clear. In this, the so-called algid stage, the body temperature may fall to 75°F. The amount of water lost by the body may be from 8 to 10 quarts in 24 hours. Blood examination may show the red cells increased to 8,000,000 from a normal of 5,000,000, while the white cell count may be as high as 60,000 per cubic centimeter. Most of the deaths occur in the first 24 hours but, if the patient survives the algid stage, the stage of reaction develops. Here the blood pressure rises to normal, color returns to the skin, the stools become less frequent, the temperature may be about normal, while the general state exhibits improvement. Nevertheless the outlook for

recovery is still uncertain for suppression of urine may develop or may persist if present and despite all efforts the sufferer, who seems on the brink of recovery, may die of uremia. Where death occurs, relatively few changes are to be found at the seat of the disease, beyond small erosions and minute hemorrhagic points in the terminal ileum.

Diagnosis.—This is made usually on the pathognomic symptoms and signs as given, aided by the known incidence of the disease in the area in which the patient is seen. It is confirmed by finding the *Vibrio* in the stools through culture methods and smears. As will be appreciated, to wait for a bacteriological confirmation in the presence of a cholera epidemic before beginning appropriate treatment will often result in the loss of the patient. Specific agglutination of the organisms in cholera-immune serum in 1:1000 dilution is also of assistance in confirming a diagnosis. The only diseases apt to be confounded with cholera are, food poisoning, bacillary dysentery, heat prostration in tropical countries (where bowel symptoms are present), and certain forms of poisoning by arsenic, mercury, mushrooms (poisonous varieties), and methyl alcohol.

Treatment.—This may be divided into general preventive measures for the community (public health practice), prophylaxis for the protection of individuals, and curative, applied to the patient who is actually seized with the disease. Cholera could be eliminated largely from the world if water supplies could be protected from pollution and if water already polluted could be barred effectively as a source of supply for drinking. In a country like India, for example, with its overpopulation under conditions of unsatisfactory sanitation, combined with extreme poverty, ignorance, and blind adherence to tradition, the total prevention of cholera is a practical impossibility, since religious pilgrimages cannot be prevented or even controlled. Neither can carriers be detected always nor the river Ganges be placed off limits, as a source of drinking water. In countries having a modern public health service there is little danger of cholera's obtaining a foothold and still less of its assuming epidemic proportions. In Oriental countries, however, there is an everpresent danger of the disease getting out of hand. In general, prophylactic measures will consist in preventing pollution of water supplies, in keeping streets clean, in prompt disposal of garbage, sewage and human wastes, with disinfection or burial as indicated, in control of the sale of raw vegetables and fruits, and in strict quarantine. This last will include isolation of all patients suspected of having cholera, and a 5 day detention period in quarantine of those who have been exposed to the disease. During an epidemic it is usually insisted that food, drinking water, and milk must be sterilized and that raw vegetables and fruits be cooked or scalded before eating. Immunity for several months may be obtained by the subcutaneous injection of 4 to 8 billion attenuated *Vibrios* (Haffkine's vaccine) at intervals of 10 days. In the presence of the actual disease, curative and life saving measures must be prompt to be availing. The most important thing is to recognize the disease at once and to give large amounts of normal or hypertonic salt solution intravenously. Here it should be

emphasized that large amounts means quarts and gallons, not pints. A delay of even an hour or two in instituting this treatment has lost many lives. During an epidemic, if cases can be detected promptly, if they can be given bed rest, can be kept warm, and if salt solution can be administered when and where they are first seen, mortality can be greatly reduced. Patients die early, not so much from toxemia as from extreme dehydration, since the circulatory system cannot function properly, much less combat the toxic effects, unless the fluid lost from the discharges can be made up at once by intravenous injections. Drugs are of little value but from time to time, small doses of morphine may alleviate the pain of the muscle cramps. Mortality in cholera varies with the epidemic and may be as high as 50 per cent. Under modern methods of treatment and organization this would probably be lower, should an epidemic occur.

Bibliography.—Snow, John, *On the Mode of Communication of Cholera* (London 1849); Koch, Robert, "The Cholera Bacillus," in *Deutsche Medicinische Wochenschrift*, vol. 10, pp. 725-728 (Berlin 1884); Pierson, George M., and Bortz, Edward L., *Cyclopedia of Medicine, Surgery and Specialties* (Philadelphia 1949).

HAROLD W. JONES, M.D.

CHOLERA INFANTUM, an old term for acute bacillary dysentery in infants. See DYS-ENTERY.

CHOLESTEATOMA, kōl-ê-stê-à-tō'mā, (1) a tumor of the brain which may occur in the bones of the skull or within the brain substance or ventricles. It is a growth of small pearly nodules, usually springing from the cerebral meninges, formed of concentric layers of endothelial or epithelial cells, often surrounding a core of cholesterol crystals and fat globules. (2) A tumor of the middle ear resulting from nature's attempt to arrest suppuration in the tympanic cavity by epidermatization, the new skin-like membrane then degenerating.

CHOLESTEROL, kō-lēs'tēr-ōl (old name CHOLESTERIN; Gr. *cholē*, bile, and *stereos*, solid), an unsaturated secondary alcohol, formula $C_{27}H_{46}O$, found throughout all the tissues and fluids of animals, but more particularly in brain and nerves. It is abundant in egg yolk, milk, wool fat, and gallstones, the latter often being almost pure cholesterol. Although isolated from gallstones in pure form in 1823, the chemical structure proved so difficult to determine that when Heinrich Wieland and Adolf Windaus were awarded the Nobel Prize for 1927 and 1928 for determining its structure, later results soon proved them wrong. The correct formula is now known to be

The complex basic ring structure, known chemically as cyclopentanoperhydrophenanthrene, is the basis of classifying a number of biologically important compounds into a group called

the steroids. These substances include, besides cholesterol, such important compounds as the sex hormones, cortisone and similar hormones of the adrenal cortex, vitamin D, the bile acids, and the cardiac glycosides or glucosides (*digitalis*) as well as many plant sterols, saponins and toad poisons.

Cholesterol is readily synthesized in the animal body from simple molecules such as acetic acid and acetoacetic acid which the body also synthesizes, usually from fat. It can also, of course, come from the diet.

The functions of cholesterol in the animal body are very poorly understood. That it is needed, especially in nerve tissue, is almost self-evident from its invariable occurrence. There is much evidence that it can serve as precursor for other important steroids such as the bile acids, and the sex and adrenocortical hormones but other research work indicates that such a path is not obligatory and that the latter compounds can be synthesized either directly or from some unknown compound which is the precursor for all the steroids. It does serve as a precursor for vitamin D, the vitamin being formed by action of ultraviolet light on 7-dehydro cholesterol in the skin.

In many cases of hardening of the arteries there is marked deposition of cholesterol in the walls of the blood vessels. This effect is believed to be due to a breakdown of the mechanism for proper metabolism of cholesterol, rather than to an excess of this compound in the diet, but the condition may be somewhat alleviated by dietary changes which restrict cholesterol intake.

Consult Fieser, A. F., and Fieser, M. A. P., *Natural Products Related to Phenanthrene*, 3d ed. (New York 1949)

M. WIGHT TAYLOR,
Associate Professor of Agricultural Biochemistry,
Rutgers University.

CHOLET, shô-lě', commune, France, in the Department of Maine-et-Loire, on the right bank of the Maine River, 32 miles southwest of Angers. Its manufactures include handkerchiefs and cotton goods called *cholettes*, flannels, and woolen stuffs, as well as cartons, footwear, toys, and organic fertilizer. The town also trades in cattle, lumber, and grain. Granite is quarried nearby.

The first considerable growth of the town occurred in the 17th century when a colony of weavers settled there under Edouard Colbert, Comte de Maulévrier. Here during the Vendean War, two actions were fought in 1793, in both of which the Royalists were decisively defeated. Pop. (1946) 26,086.

CHOLIAMB, kô'li-ămb (Gr. *choliambos*, the lame iambus), an iambic trimeter, the last foot of which, instead of being an iambus, is a trochee or spondee, which gives it a lame motion. It is also called scazon (Greek *skazôn*, to halt) or versus Hipponacticus, because of the use that the satirist Hipponax of Ephesus made of it.

CHOLINE, kô'lên; kôl'ên, -în, a nitrogenous base ($C_5H_{12}NO_2$) found in both plants and animals. It is a compound of lecithin and other phospholids. Used as a drug it has an effect similar to that of parasympathetic stimulation. It is a vitamin of the B complex.

CHOLON, shô-lôn', city, Viet Nam, in

Cochinchina, 4 miles southwest of Saigon, on the left bank of the Donnai, an affluent of the Saigon River. It is connected with Saigon by a railroad as well as by roads and canals. It is the center of an important rice-producing area for which it is the market. Besides rice processing, its industries include distilling, soap, and tobacco processing. The rice industry was developed by the Chinese, representing about a third of the population, who are also responsible for the small boat-building industry and a greater part of the commercial river traffic.

Founded by Chinese immigrants from Bien-hoa in 1778, Cholon became a municipality in 1879 and gradually merged with Saigon to form a large urban area. Since 1932 Saigon and Cholon have been jointly administered.

During World War II Cholon was occupied by the Japanese and was the scene of much suffering in the subsequent Viet Nam Revolution. Pop. (1936) 145,254; (1949 est.) 100,000.

CHOLULA, chô-lôô'lă (in full **CHOLULA DE RIVADABIA**, thă-rê-vă-thă-vyă), town, Mexico, in the state of Puebla. It is 6 miles west of La Puebla, with which it is connected by rail, and 60 miles southeast of the city of Mexico, at an altitude of 7,000 feet. The streets are regular and spacious, the houses mostly of one story and flat-roofed. A rail junction, it produces cereals, maguey, fruit, vegetables, and livestock, and its industries include wine and liquor distilling, flour milling and textile manufacturing. Nearby is a pre-Columbian pyramid (175 feet high) of clay and brick, surmounted by a Christian church. The town is famous for its many churches occupying the sites where native temples used to stand.

Cholula was the chief city of a semi-independent state settled by a Toltec tribe. Before the coming of the Europeans, the inhabitants carried on a considerable trade and had a type of democratic government. It was visited by Cortes in 1519, and in spite of his friendly reception by the inhabitants, he massacred a portion of the population, suspecting a plot against the Spaniards. Pop. (1940) 8,424.

CHOMO LHARI, chô'mô hlă'rê, or **CHUMALHARI**, chôô-mă-, a mountain peak in the Himalayas on the undefined border between Bhutan and Tibet.

CHOMUTOV, kô'môô-tôf (German **KOMOTAU**, kô'mô-tou), city, Czechoslovakia, is located in northwest Bohemia in the foothills of the Erzgebirge, 52 miles northwest of Prague. Chiefly an industrial center, it is a rail junction and manufactures industrial pipes, wire cables, cutlery, turbines, and textiles. Its metallurgical works are employed in finishing metal products manufactured at Kladno. In the vicinity coal is mined, hops are grown, and dahlias extensively cultivated. Pop. (1947) 26,697.

CHONDROSTEI, kôn-drôs'tê-î, an order of ganoid fishes of lowly organization, such as the sturgeon, paddlefishes and their fossil predecessors. The internal skeleton is but little ossified, the vertebrae and most of the skull remaining in a stage of pure cartilage; but the skull is enclosed by close-fitting dermal bony plates. There are no true scales, but a small number of longitudinal rows of large bony plates,

with granules on the intervening skin. The elongated snout, stout body, large fins, and strongly heterocercal tail complete the aspect of these survivors of a once dominant race that flourished from the Lower Devonian through the Mesozoic, except the Cretaceous period; and from after the Eocene steadily diminished, until of seven great families only two remain, represented by a few species that exhibit degeneracy from the ancient type.

Consult Zittel, Karl Alfred von, *Grundzüge der Paläontologie* (Munich 1895); Woodward, Sir Arthur Smith, *Outlines of Vertebrate Paleontology* (Cambridge, Eng., 1898); Romer, Alfred Sherwood, *Vertebrate Paleontology*, 2d ed. (Chicago 1945).

CHONDRUS, kōn'drūs, in botany, a small genus of marine algae the best-known species being *C. crispus*, the carrageen (q.v.).

CHONE, chō'nā, city, Ecuador, located in the tropical lowlands of Manabí Province, 110 miles west-southwest of Quito. It has rich cacao, coffee, and sugar plantations; it also produces rice, balsa wood, and tagua nuts. It is noted as a manufacturing center for Panama hats. Pop. (1950) 8,030.

CHONGJU, chŭng-jōō, town, North Korea, in North Pyongan Province. It is an agricultural center and gold is mined nearby. Pop. (1944) 18,633.

CHONGJU, city, South Korea, located in North Chungchong Province, 70 miles south-southeast of Seoul. It is an agricultural and industrial center. Pop. (1949) 64,571.

CHONOS, chō'nōs, an Indian tribe, now almost extinct, who occupied the islands of the Chonos Archipelago, and the neighboring Chilean coast. Their huts resembled bark-topped wigwams. Some shell-middens and a few artifacts have been discovered on Chiloé Island, showing a primitive culture. Their language was thought to form a distinct stock but may have been an Alacalufan dialect.

CHONOS ARCHIPELAGO, islands, Chile, about a thousand in number, located in Chiloé Province, lying along the coast of Patagonia. The archipelago is separated from the mainland by Moraleda Channel. Most of the islands are semibarren and uninhabited except for a few Chonos Indians. Melinka, on Ascensión Island in the Guaitecas group, which is sometimes considered a part of Chonos Archipelago, and Puerto Lagunas, on Melchor Island, are the only settlements of any importance. The latter maintains a radio station.

CHOPIN, shō-pān', **Frédéric-François**, Polish-French composer and pianist; b. Żelazowa Wola (near Warsaw), Poland, probably Feb. 22, 1810; d. Paris, France, Oct. 17, 1849. The exact date of Chopin's birth cannot be established beyond doubt. His father, Nicolas (1771-1844), was a Frenchman who had become first a bookkeeper and then a teacher of French in Poland; his mother, Tekla Justina Krzyżanowska (1782-1861), was an upper-class Polish woman in reduced circumstances. Frédéric-François, one of four children, was an only son. He very early displayed an intense, emotional interest in music, and began eagerly to study the piano when

only six, joining his elder sister Ludwika (Louise) in taking lessons from Adalbert Zywny, a Czech who taught pupils from the small boarding school that their parents ran to supplement Nicolas' income as a lyceum teacher. In 1817 his first published composition was issued privately in Warsaw; it was a Polonaise in G Minor dedicated to Countess Victoire Skarbek, by whose family his parents had formerly been employed. The boy appeared at a Warsaw salon concert on his eighth birthday, playing a concerto by Adalbert Gyrowetz. Later in 1818 he was permitted to present the visiting Dowager Czarina Marie Feodorovna (1759-1828), with two polonaises of his own composition. In 1822 or 1823 he began to study composition with an able Silesian named Joseph Elsner, and in the latter year he entered the Lyceum in which his father taught, studying Greek, Latin, mathematics, natural history, and the Polish historical and literary past. He never became a really well-educated man, and his range of intellectual interests always remained narrow.

Chopin's Opus 1, a Rondo in C Minor, was published in Warsaw in 1825. The earliest published example of his music to maintain strictly musical interest is his Opus 2, Variations for Piano, with sketchy orchestral accompaniment, on *Là ci darem la mano* from Mozart's *Don Giovanni*, probably composed when Chopin was 17. During 1828 a family friend took the youth on a visit to Berlin, where he first heard opera performed on a professional scale, and where he first viewed the great world of Western Europe. In 1829 he gave two concerts in Vienna, both including his *Krakowiak*, a concert rondo for piano and orchestra. During 1829, too, he became infatuated with a young singer, Constantia Gladkowska, a fellow pupil at the Warsaw Conservatory of Music, in which he had enrolled three years earlier. His impact on the aristocratic Warsaw public as both pianist and composer was reinforced during 1830 when he played the solo parts in his two piano concertos (F Minor and E Minor). Later that year, nevertheless, he left Poland forever, going via Breslau (Wrocław), Dresden (where he probably initiated his lifelong friendship with Countess Delphine Potocka), Prague, Vienna, Munich, and Stuttgart, to Paris. He reached the French capital in September 1831 and in effect settled down there for the rest of his life. He seems never to have known that two sisters of his father were still living in eastern France, in the Vosges Department.

At 21, Chopin had already earned a considerable reputation in German and Austrian musical circles, but his period of greatest prominence and productivity began shortly after he settled in Paris. There he soon won the affectionate regard of aristocratic music lovers, and notably of titled women. He was at various times on friendly terms with such men as Vincenzo Bellini, Hector Berlioz, Eugène Delacroix, Théophile Gautier, Franz Liszt, and Giacomo Meyerbeer. In 1835, visiting Karlovy Vary (Karlovy Vary), he saw his parents for the last time. On that journey he also met Clara Wieck and Robert Schumann, and at Dresden fell in love with a Polish girl, Marie Wodzinska, to whom he proposed marriage the following year. In 1836, however, he began at Paris his enduringly famous relationship with George Sand (Baronne Dudevant).

Chopin's physical constitution was always weak, and he probably suffered from tuberculosis

ost of his life. The breaking off of his engagement to Marie Wodzinska in 1836 was in part caused by her parents' fear of his physical condition, in part by the thinness of his purse, and in part by peculiarities of his psychic nature. In spite of his unstable health, however, he spent the winter of 1838-1839 in Majorca with George Sand. There they lived under conditions of weather and housing which were damaging to his body, and he almost died on his return to France early in 1839. During the next few years, his increasingly rare semipublic concerts, his wavering health, and his aristocratic demeanor and sympathies combined to surround his figure with an air of legend and mystery. From 1843 to 1848, partly because he was well aware that his delicate, sensitive style of pianism could not compete with the bravura of the new school of virtuosos, he gave no concerts. His relationship with George Sand had begun to break up in 1845; it ended in 1847 with quarrels and bitter recrimination, and they were never reconciled.

Chopin made his last Paris concert appearance in the Salle Pleyel on Feb. 16, 1848. The revolution that overthrew Louis Philippe broke out a few days later, and in April the ailing composer crossed to England to escape the turbulence of a Paris he could scarcely understand. In May, he played before Victoria and Albert in London. His illness was turning grave and he was taken finally in hand by one of his pupils, an aristocratic Scotswoman named Jane Stirling. She hospitably persuaded him to spend several months in the inclement Scottish autumn, and when he returned to Paris in November 1848, he was dying. In 1849 he had to abandon all his teaching, and his financial condition was severely worsened. Jane Stirling smoothed his last weeks with a substantial gift of money, and his sister Ludwika came from Poland to nurse him. He died at 12 Place Vendôme, Paris, on Oct. 17, 1849, and was buried in Père-Lachaise Cemetery. On Oct. 30, 1850, a memorial monument designed by George Sand's son-in-law, Jean Baptiste Clésinger, was unveiled at his grave, over which earth sent from Poland was symbolically sprinkled.

An enduring story pictures Chopin as having had a love affair with Delphine Potocka. That the two were very close during his final years is suggested by her having been one of the last of his circle of friends to visit him when he was dying. To her he dedicated both the F Minor Piano Concerto and the *Minute Waltz*. But the authenticity of the Potocka correspondence, on which, for example, the picture of their complete intimacy in Kazimierz Wierzyński's *The Life and Death of Chopin* (New York 1949) is based, has been questioned, and the letters may well be spurious. Women played a very important role in Chopin's life—Constantia Gladowska, Marie Wodzinska, Delphine Potocka, and Jane Stirling among them—but he never married, and only George Sand was certainly his mistress. As a youth he had been romantically attached to several male friends, notably Titus Wojciechowski, but he was too reserved and proud to surrender himself wholly to anyone. The final impression of him is that of a man surrounded by friends, male and female, but always fundamentally alone with himself and his art.

Universal Recognition.—Chopin's position in music is unique in several ways. He is the only composer to have won universal recognition entirely for piano music: all of his compositions are

either for piano solo or include a piano part. He never composed an opera, a symphony, or an overture, and his concerted pieces for piano and orchestra were little more than juvenilia. Although he wrote a cello sonata and a trio for piano, violin, and cello, he did not cultivate chamber music. His piano compositions won for him early in his life a high reputation that endures unchanged. Adverse judgments have always been made from time to time of his weaker compositions, as well as of a vein of perfumed, self-pitying melancholy in some of the stronger ones. But Chopin has always been admired intensely by both musicians and the musical public. No other great composer has matched his ability to conquer and hold very numerous listeners without losing the esteem of his peers. His music remains the central fact in the standard repertoire of pianists.

Musical Style.—The amount of Polish influence audible in Chopin's music has been disputed. Certainly his unclassical harmonic motions, his wide rhythmic variety, and his chivalresque attitudes seem in part to have resulted from the Polish elements of his background. In his polonaises and the more than 50 mazurkas, he employed Polish dance forms, subtilizing and enriching them. Traces of Polish musical procedures are audible in several of his other compositions. But it is all but impossible to detect anything specifically Polish in a majority of the ballades, études, impromptus, nocturnes, preludes, scherzos, or waltzes, or in any of the three piano sonatas, the barcarolle, berceuse, or fantasia. For Chopin, despite his intense patriotism, was not artistically a nationalist. In quantity and in manner the body of Chopin's music is as much Western as Slavic, as much French, Italian, and Austro-German as Polish. Above everything else, it was his own: he is instantly recognizable even in isolated measures. Few artists have been original so effortlessly and completely.

Although earlier musicians had composed great music for the piano (and harpsichord), Chopin was in an important sense the first great composer of piano music. His best compositions appear to have grown organically from the instrument, so intense was his imaginative and creative response to the piano's innate qualities and capabilities. He exploited its potentialities deeply, so deeply that it can still be said more than one century later that he who can play the Chopin études can play anything. His harmonic originality greatly increased the speed with which 18th century harmonic manners decayed; influencing, among others, Liszt and Richard Wagner, it became directly ancestral to 20th century change and development. Equally effective was Chopin's example as a fashioner of novel formal patterns, necessary substitutions for 18th century forms weakened by romanticism's blurring of the harmonic logic with which they had evolved.

Bibliography.—The first important biography of Chopin was that of Frederick Niecks (1888). Later biographical and critical materials are to be found in books by Gerald Abraham, Édouard Ganche, Arthur Hedley, Ferdinand Hoessick, James Gibbons Huneker, Zdzisław Jachimiecki, Hugo Leichtentritt, William Murdoch, Ippolito Valetta, and Herbert Weinstock. The so-called *Liszt Life of Chopin* is only in part by Liszt, and in any case is of small value. No truly definitive complete edition of Chopin's music has ever been made generally available; that edited for the Oxford University Press by Édouard Ganche is the most scholarly.

HERBERT WEINSTOCK,
Author of "Chopin, the Man and His Music."

CHOPIN, chōp'in, a Scotch liquid measure containing one and one-half British pints. The chopin, in name at least, was derived from the French, with whom a similar measure was in use until the introduction of the metric system.

CHOPINE, chō-pēn', an elevated shoe or clog, now obsolete but introduced into England during Queen Elizabeth's reign, and becoming popular with ladies of the court. Shakespeare mentions them in *Hamlet* (Act II, scene 2): "B'yr lady, your ladyship is nearer to heaven than when I saw you last by the altitude of a chopine."

CHOPTANK, chōp'tānk, **RIVER**, rises in Kent County, Delaware, flows southwest into Maryland, and near the south extremity of Talbot County spreads into an estuary several miles wide and nearly 20 miles long, through which it empties into Chesapeake Bay; the total course is about 100 miles. It is navigable for sloops to the mouth of Tuckahoe Creek, a distance of about 50 miles.

CHOPUNNISH, chō-pūn'ish, or **NEZ PERCE**, a tribe of North American Indians, also known as Sahaptin, who now live on the Nez Percé Reservation, in Idaho, and on the Colville Reservation in Washington. The name Nez Percé originated from the custom formerly followed of piercing the nose. In the Nez Percé War of 1877 the tribe was under the control of Chief Joseph (q.v.), who forbade his men to interfere with any white non-combatants. See also SHAHAPTIAN INDIANS.

CHORAGIC, kō-rāj'ik, **MONUMENT**, in ancient Greece, a monument erected in honor of one who had gained a prize as choragus (q.v.), or organizer of the play and chorus. The remains of two very fine monuments of this sort are still to be seen at Athens, namely, those of Thrasylus and of Lysicrates, the last popularly called the Lantern of Demosthenes.

CHORAGUS, kō-rā'gūs, among the ancient Greeks, the musician who directed each of the choruses furnished by the 10 Attic tribes for the public festivals. (Such an office was established in Oxford University in 1626 by Dr. William Heyther, but it was soon abolished; however, in 1926 it was revived.) The person of the Greek choragus was inviolable, as well as those of the members of the chorus. The choragus who was adjudged to have performed his duty best received an ornamental tripod, engraved by a skilful artist, and bearing the name of the tribe which had gained the victory, of the citizen who had paid the expense, and of the master who had trained the choir. These tripods were set up as public monuments on pillars or other structures. A street in Athens which contained a great number of such monuments was called the Street of the Tripods. The most remarkable of these monuments yet remaining is the choragic monument of Lysicrates. (See also CHORAGIC MONUMENT; CHORUS.)

CHORAL, kō-rāl, kō-rāl', or **CHORALE**, kō-rāl' (Ger. *choral*). The term *choral* is used both as an adjective and as a noun. As an adjective it is accented on the first syllable, and means pertaining to a chorus or a choir, for example, a *choral* composition, or a *choral* soci-

ety. As a noun the word is accented on the second syllable, and in general usage the term *chor-al'* (without the final e) refers to the plain song of the Catholic Church, in German called *Gregorianischer Choral* (see PLAIN SONG and also GREGORIAN CHANT). The term also designates the hymn tunes of the German Protestant Church, and in this sense it is generally spelled in English with the final e. This form of chorale was introduced by Martin Luther in the early part of the 16th century. The hymns were written by Luther in the vernacular, founded on the simpler tunes, and arranged to music which was more rhythmic than that in general use. This change appealed to the people and brought out the power of music to kindle religious emotion. This change also had a great effect upon church music throughout Germany, and within a short time after its introduction a literature of remarkable dignity, simplicity and earnestness was produced. During the 16th and 17th centuries many excellent examples of chorales were brought forth, probably the most important, though not the first, of the early collections being the *Enchiridion*, or handbook, published by Luther and his friend Johann Walther, at Erfurt, in 1524. This book contained a preface by Luther himself, and was undoubtedly the foundation for the extensive number of collections which continued to appear till the latter part of the 17th century, but which, for many reasons, religious as well as political, ceased to be popular shortly after that time. Chorales were generally accompanied on the organ, and this custom, together with that of playing and writing so-called figured chorales, soon led to a greater development of harmony and counterpoint, so that the art of playing became of first importance to the successful singing of the chorale.

Many of the chorales were original, many were revisions of old church tunes, and some were adapted from altogether secular sources. Of these latter, the most famous collection was that of Claude Goudimel, published in Paris in 1565, the majority of which were soon incorporated into the German collections, and one of which, "Old Hundred," became very popular in England. Others taken from secular sources are "Herr Christ der einig Gott's Sohn," taken from "Ich hört ein Fräulein klagen," and "Herzlich thut mich verlangen," which appears several times in Bach's "Matthäus-Passion," taken from "Mein Gemuth ist mir verwirret." On the other hand, there are many based upon church tunes, such as "Der du bist drei in Einigkeit," taken from "O beata lux Trinitatis."

The authorship of many chorales is, however, obscure and uncertain, such as the "Es ist gewisslich," generally attributed in England to Luther. There is doubt of his authorship even of the famous "Ein feste Burg ist unser Gott" which has been incorporated into the compositions of Meyerbeer in "The Huguenots," of Mendelssohn in his "Reformation Symphony," of Wagner in his "Kaiser Marsch," and of Bach in one of his cantatas. One of Johannes Crüger's chorales, "Nun danket alle Gott," became well known in England from its incorporation in Mendelssohn's "Lobgesang."

Today the chorales are best-known through their harmonizations by Johann Sebastian Bach.

CHORAL SOCIETIES. A choral society is a body of singers formed for the purpose of

studying and performing choral works. Until comparatively modern times chorus singers were generally professional musicians, and the chorus that took part in the production of an oratorio did not usually number over 40.

Today choral societies consist of amateurs as well as professionals and are much larger than their predecessors, an average chorus numbering 150 to 200 voices. It is possible that the magnificent effect of the chorus formed to celebrate the commemoration of Handel's birth by performances given in Westminster Abbey and the Pantheon in London in 1784 may have been a great factor in the formation of choral societies in England. This chorus was the largest that had ever been formed up to that time. It numbered 274 and the orchestra 251. At a subsequent festival in 1791 the chorus and orchestra were said to have numbered over 1,000, while for the Handel Festival held in the Crystal Palace in London in 1874 the chorus numbered 3,200 and the orchestra over 500. In America mammoth choruses for festivals have sometimes numbered many thousands; perhaps the largest was the chorus of 20,000, accompanied by an orchestra of 2,000, which sang at the World Peace Jubilee in Boston in 1872.

It is doubtful whether such a large body of singers and players is materially more effective than a smaller one. The impression on first hearing an enormous chorus is nearly always one of disappointment at the volume of sound. The explanation is made that the large hall necessary for such a large chorus and audience causes a loss of quantity of tone, but this is disproved by comparisons made at a Saengerfest held in Philadelphia, Pa. Here the effect of the entire mass chorus of 5,000 male voices was not much greater than that of a single society of 250 voices. There was a difference, of course, but the volume was not 20 times greater, not even twice as great.

A well-balanced chorus of from 200 to 500 voices is now generally acknowledged to be more effective and much easier to command than the overgrown chorus assembled for a festival. Choruses of this size are numerous in the United States, Germany and England, where choral work, both religious and secular, is highly appreciated and supported.

The Berlin *Singakademie*, still in existence and world-renowned, was founded in 1791 with 27 members and now numbers 600. Felix Mendelssohn was a guest conductor in 1829.

In Great Britain choral music has long been an important part of the musical life of the nation. In London and the provincial cities the choral societies include the Royal Choral Society, the British Broadcasting Corporation Choral Society, the Newcastle-upon-Tyne Bach Choir, the Handel Society, the London Choral Society, the Birmingham City Choir and Festival Choral Society, the Cambridge University Musical Society, the Hull Choral Union, the Manchester Hallé Society, the Leeds Choral Union, the Oxford Bach Choir, the Edinburgh Royal Choral Union, the Glasgow Choral Union and the Glasgow Orpheus Choir. In Ireland there are the Belfast Philharmonic Society and the Dublin University Choral Society.

In the United States a singing class founded by William Billings became the Stoughton (Mass.) Musical Society in 1786 and continued into the 20th century as the oldest choral society

in the country. Next in order of age, and of greater size and importance, was the Handel and Haydn Society of Boston, founded in 1815, and today one of the most important choral societies in the world. Until 1847 the elected president of the society acted as its conductor, but at that time it was felt that the engagement of a permanent professional conductor would raise the musical standards of the society. Its most outstanding conductors have been Charles Edward Horn (1848-1849), Carl Zerrahn (1854-1895), Reinhold Ludwig Herman (1898-1899), Emil Mollenhauer (1899-1927), and Thompson Stone (1927-). Another important Boston choral group, the Cecilia Society, was formed in 1874 under the patronage of the Harvard Musical Association, and in 1876 became an independent organization. Its conductors have included Benjamin Johnson Lang (1874-1907), Wallace Goodrich (1907-1910), Max Fiedler (1910-1911), Arthur Mees (1911-1915), Chalmers Clifton (1915-1917), Arthur Shepherd (1917-1918), Georges Longy (1918-1919), Ernest Mitchell (1919-1920), Agide Jacchia (1920-1924), Malcolm Lang (1924-1926), and more recently Arthur Fiedler, Victor Manusevitch and Alfred Nash Patterson.

In New York a number of choral societies, the Handel and Haydn, the New York Choral Society and the New York Sacred Music Society, dating from 1824 to 1849, fostered the taste for choral music. After this for more than 20 years no long-continued effort was made to carry on the work, until in 1873 Dr. Leopold Damrosch founded the New York Oratorio Society which, beginning with about 60 members, now numbers nearly 300. Walter Damrosch, son of Dr. Leopold Damrosch, succeeded him as conductor in 1885 and continued until 1898 when he was in turn succeeded by his brother Frank Damrosch who served from 1898 to 1912. Subsequent conductors have been Louis Koemmenich (1912-1917), Walter Damrosch (1917-1922), Albert Stoessel (1922-1943), Albert Greenfield (1943-).

Another important choral society in New York is the Schola Cantorum, consisting of professional singers, and distinguished for its introduction of new choral works and music which is not often heard. From 1909 to 1912 this organization was known as the MacDowell Chorus, sponsored by the MacDowell Club of New York. In 1912, it assumed its present name. Kurt Schindler conducted the organization from 1909 to 1927, and since then it has been conducted by Hugh Ross.

In other large cities of the nation the famous choral societies have been: in Philadelphia the Haydn, the Harmonic, and the Cecilia societies, and the Philadelphia Chorus; in Baltimore the Oratorio Society; in Washington the Choral Society; in Chicago the Apollo Club; and in Grand Rapids the Saint Cecilia Society.

Many of the great choruses of the nation are assembled and trained for annual music festivals in various cities. The outstanding ones have been the Cincinnati May Festival chorus, organized by Theodore Thomas in 1873; the Worcester (Mass.) Music Festival, sponsored by the Worcester County Musical Association, founded in 1871; the Ann Arbor (Mich.) May Festival, which had its inception in a choral union organized in 1879 by the University (of Michigan) Musical Society. The first actual festival was given in May of 1893.

Special mention should be made of the Bach Choir of Bethlehem, Pa., organized in its present form by John Frederick Wolle in 1898. The city of Bethlehem has a long music history. As early as 1742 the Moravian settlers held a "singstude" and from 1744 a Collegium Musicum was maintained, which was succeeded in 1820 by a Philharmonic Society. In 1882 Wolle organized the Bethlehem Choral Union, which in 1892 gave the first United States performance of Bach's *St. Matthew's Passion* in its entirety. In 1900 the Bethlehem Bach Choir was organized and continued until 1905 when Wolle moved to California. He returned to Bethlehem in 1911, and the work of the choir was resumed with the financial assistance of Charles M. Schwab, the steel magnate. Wolle continued as conductor until his death in 1933. He was succeeded by Bruce Carey who served until 1938, when Ifor Jones became conductor. Originally the festivals (lasting for two days in May) were held in the Memorial Church, but since 1912 they have been given in the Packer Chapel of Lehigh University. At each festival Bach's *B Minor Mass* is performed, and the original choir of 80 has grown to almost 300.

CHORALE. See CHORAL; CHORAL SOCIETIES; MUSIC; GREGORIAN CHANT.

CHORALE PRELUDE. An instrumental composition (generally for organ) based on a Protestant chorale, and intended for performance before the singing of the chorale by the congregation.

CHORAZIN, kō-rā'zīn, city, Palestine, in which Christ's mighty works were done, but named only in his denunciation (Matthew 11:21; Luke 10:13). It was known to Saint Jerome, who describes it as on the shore of the Sea of Galilee, two miles from the ruined city of Capernaum. Some locate it at the modern Tell Hum, three miles northeast of Capernaum, but this location is doubtful. Though the town was evidently of some importance, judging from the extensive ruins to be seen there, it has received little or no attention in ancient writings.

CHORD. 1. *In music*, the simultaneous sounding of several tones. Harmonically, the basic chord is the triad of three tones, formed by adding two tones to the basic tone or root, each a third above the other. Thus the major triad on C consists of C, E and G, representing the intervals of a major third (C-E) and above it a minor third (E-G). The minor triad on C consists of C, E flat, and G, or a minor third (C-E flat) and above it a major third (E flat-G). A diminished triad consists of three tones forming two minor thirds (C-E flat-G flat). The consonant chords are the major, minor, and diminished triads of any key or tonality and their inversions, an inversion being formed by using as the lowest tone of a chord a tone other than its actual root (i.e. in the C major triad using E as the lowest tone) thus forming the *sixth* chord (G-C-E), or second inversion.

Dissonant chords are formed by adding further tones, each a third above the triad. Thus a seventh chord is formed by the root, the third, the fifth, and the seventh tones, the seventh being a third higher than the fifth. In the key of C major, the seventh chord on G is G,B,D, and F. Since G is the fifth tone of the scale in the key

of C, and since the fifth tone of the scale is known as the dominant, the seventh chord on G is known as the dominant seventh of the key of C. Inasmuch as each seventh chord consists of four tones, it is capable of three inversions—the *six-five-three* chord (in the case of the dominant seventh of C—B,D,F,G); the *six-four-three* chord (D,F,G,B), and the *six-four-two* chord (F,G,B,D). Seventh chords may be formed on any tone of the scale. The dominant seventh, on the fifth of the scale, is known as a primary seventh chord, since its resolution to the tonic triad (formed on the tonic, or key-note of the scale) results in what is known as a perfect cadence, giving a final and satisfactory conclusion to a phrase, or to a composition. Seventh chords on the tones other than the dominant tone of the major scale are known as secondary seventh chords. The diminished seventh chord is one in which the tones of the chord are a minor third apart, and the extreme tones of the chord are a diminished seventh apart. The diminished seventh chord is formed on the fourth, sixth and seventh tones of the harmonic minor scale—in C minor, F, A flat, B, D; A flat, B, D, F, and B, D, F, A flat.

The addition of a fifth tone to the seventh chord, a third above the seventh, forms a ninth chord. Thus, the addition of an A to the dominant seventh chord on C major forms a dominant ninth chord—G, B, D, F, A. Similarly, the addition of further superimposed tones at the interval of a third will produce eleventh and thirteenth chords, each having its name from the fact that its highest tone is an eleventh or a thirteenth above its root. (For the principles of chord progression, see HARMONY.)

2. *In geometry*, a chord is the straight line which joins the two extremities of the arc (q.v.) of a curve; so called from the resemblance which the arc and chord together have to a bow and its string, the chord representing the string. The chord of a circular arc is obtained by multiplying the radius by twice the sine of half the angle which the arc subtends at the center.

CHORDATA, kōr-dā'tā, a primary division or phylum of the animal kingdom comprising those animals which have, at least in early developmental stages: (1) a notochord (q.v.), hence the name of the phylum; (2) a dorsal tubular nerve cord; and (3) pharyngeal gill slits. Groups included as subphyla are Vertebrata (formerly considered a phylum), Cephalochorda (*Amphioxus*), Urochorda or Tunicata, and, somewhat doubtfully, the Hemichorda (*Balanoglossus*). See especially VERTEBRATA.

CHOREA, kō-rē'ā, or **SAINT VITUS' DANCE**, is a disease of the central nervous system characterized by disturbances of spontaneous and co-ordinating movements. It occurs usually in the later years of childhood or less frequently the earlier years of adolescence and is twice as common in girls than in boys. The motor symptoms vary from slight unrest and irritability to marked disturbances. In mild cases the choreic movements are limited to the face and to single muscles, in more severe ones the entire body musculature may be involved. The movements in the incipient stage are often scarcely noticed. There are at first slight irregular, jerky movements with a tendency to drop articles, due to a relaxation of grasp occurring simultaneously.

with the muscular jerk. There are also premonitory symptoms of listlessness, insomnia, nervous irritability, loss of appetite, and sometimes anemia. Psychic manifestations may accompany the development of the chorea in the form of night terrors, transitory hallucinations, all of which are only temporary and belong to the less severe forms. Distinct delirium, stupor, and acute dementia belong only to the severe form for which the prognosis is unfavorable. The usual course of chorea is from 6 to 10 weeks, but not infrequently it extends over three or four months, or the movements may persist for many months due to the nervous condition of the child. Recurrent attacks are also frequent. All of this points to a broader view of the causation than is usually accepted. There is fundamentally present, probably, an inferior or slowly developing psychomotor-cerebellar integration, which is inadequate to the grade of motor adaptation demanded by the rapidly growing body. Choreia therefore a fatigue symptom arising from a slight degree of infection or even from mere excess of motor activity. Rheumatic and other infections aid in reducing the physiological efficiency, but probably have not the specific etiological value that has been assigned to them. Neonatal syphilis, by interfering with the normal development of the nervous system, is a causative factor in certain choreas.

The best treatment for chorea is rest in bed during course of the active symptoms. Excitement of all kinds, play, or intellectual effort should be avoided. There should be a full nourishing diet and during convalescence gentle exercise in the open air. A solution of arsenic was once in frequent use as a remedy as was the intravenous administration of neosalvarsan, but the use of sulphur drugs and fever therapy is now generally approved. In chronic chorea much can be done in overcoming the persistent motor disturbance by judicious training through passive and voluntary movements under guidance. The voluntary movements are very simple at first and gradually become more complex, thereby assisting in establishing once more freedom and precision of movement through coordination.

There are also habit choreas which may be hysterical imitation or may be milder forms of convulsive tics, from which, however, true chorea can be differentiated. There are also choreas appearing in adults. The most serious of these is the chorea of pregnancy. It usually occurs with the first pregnancy and may recur with succeeding pregnancies. It soon ceases after the termination of the pregnancy. (For hereditary chorea see HUNTINGTON'S DISEASE.) The name St. Vitus's Dance was acquired from a dancing mania common at one time in Germany and which was said to be cured by pilgrimages to the shrine of St. Vitus. The name has been retained although chorea is an entirely different affection from those outbreaks of mental and physical excitement.

Consult Jelliffe, S. E., and White, W. A., *Diseases of the Nervous System*, 6th ed. (Philadelphia 1935).

SMITH ELY JELLIFFE.

CHOREOGRAPHY, a system of dance notation, the art of teaching the steps of a dance by written signs. Evidence of its use has been found in Egypt, and the figure dances of ancient Greece were chalked on the floor in signs, that the dancers might learn them. See also BALLET.

CHORION, kō'ri-ŏn, in embryology and natural history, a term denoting an anatomical structure found in connection with the developing embryo. The chorion is the outer covering of the fetus *in utero*. The term is also used in zoology to denote the external protective membrane which covers the eggs of different animals, especially those of insects.

CHORLEY, chōr'li, Henry Fothergill, English music critic, poet, and novelist: b. Blackley Hurst, Lancashire, Dec. 15, 1808; d. London, Feb. 16, 1872. He became a contributor to the *Athenaeum* in 1830, and in 1833 he joined its staff as literary and musical reviewer, displaying fine perception and exquisite taste in his work; he retired in 1868. His finely written novels, many of them under the pseudonym Paul Bell, made small appeal to public tastes, and his plays, with the exception of *Old Love and New Fortune*, are weak. While his verse was graceful and witty, it was highly artificial. His books included: *Music and Manners in France and North Germany* (1841); *Pomfret* (1845); *Modern German Music* (1854); *Roccella* (1859); *Thirty Years' Musical Recollections* (1862); *The Prodigy* (1866); *Duchess Eleanor* (1866).

CHORLEY, municipal borough, England, in Lancashire, 19 miles west-northwest of Manchester. The manufacture of cotton goods is the principal industry, and there are also railway carriage works, and metal foundries. In the vicinity are coal, lead, and iron mines, and millstone quarries. Pop. (1947 est.) 32,090.

CHOROID or **CHORIOID**, one of the four principal coats of the eyeball. See *EYE—Anatomy and Physiology*.

CHORON, shō-rōn', Alexandre Étienne, French musician and writer on music: b. Caen, Oct. 21, 1772; d. Paris, June 29, 1834. Besides being a talented musician, he was an excellent scholar, linguist, and mathematician. He became a music publisher in 1805, and for some years published the works of the best masters. During 1816-1817 he was director of the Paris Opera, and he then founded the École de Musique Classique et Religieuse, which he headed until 1830. He composed a song entitled *La Sentinelle* which achieved wide popularity in France. His writings included *Principes de composition des écoles d'Italie* (1808) and *Dictionnaire historique des musiciens* (with F. J. M. Fayolle, 1810-1811). He did not complete his most ambitious work, *Introduction à l'étude générale et raisonnée de la musique*.

CHORUS, originally a special feature in the Greek drama. During the most flourishing period of Attic tragedy the chorus was a troupe of male performers, wearing masks and representing male or female characters, who, during the whole representation, were spectators of the action. In the intervals of the action the chorus chanted songs relating to the subject of the performance and which were intended either to augment the impression or to express the feeling of the audience on the course of the action. Sometimes it even took a direct part in the action by observations on the conduct of the dramatic characters, by advice, consolation, exhortation, or dissuasion. It usually represented a

part, generally the oldest portion of the people, where the action happened, sometimes the counselors of the king. The chorus was an indispensable part of the representation. In the beginning it consisted of a great number of persons, sometimes as many as 50; but the number of the tragic chorus was afterward limited to 15; while the chorus in comedy numbered 24. The exhibition of a chorus was in Athens an honorable civil charge, and was called choragy. (See CHORAGUS). The leader or chief of a chorus was called coryphaeus, who spoke in the name of the rest when the chorus participated in the action. The chorus was often divided into two parts, who sang alternately. The divisions of the chorus were not stationary, but moved from one side of the stage to the other; from which circumstance the names of the portions of verse which they recited, *strophe*, *antistrophe*, and *epode*, are derived. But it cannot be determined in what manner the chorus sang. It is probable that it was in a sort of solemn recitative, and that their melodies, if we may call them so consisted in unisons and octaves, and were very simple. They were accompanied by flutes. With the decline of ancient tragedy the chorus was omitted. Some modern tragedians, as Jean Baptiste Racine (q.v.) in France and Johann C. F. von Schiller (q.v.) in Germany, attempted, with more or less success, to imitate or revive the Greek chorus. Shakespeare employed devices founded on it.

Chorus, in modern music, is that part of a composite vocal performance which is executed by the whole body of the singers, in contradistinction to the solo airs and concerted pieces for selected voices. The singers themselves are also called the chorus.

CHORZOW, kó'zhöf, Poland, city of the province of Slask (Silesia or Schlesien), 110 miles southeast of Breslau (Wrocław) and 5 miles south of Beuthen (Bytom); it is known also as KROLEWSKA HUTA and, in German, KÖNIGSHÜTTE. The city is situated in the rich coal, zinc, and iron mining district of Katowice. Its chief industry is in its great smelting works, with allied ammonia, tar, and benzine plants, and iron and steel foundries and puddling and rolling mills; there are also important glass and brick works. Chorzow was founded in 1797, at which period the province formed part of the kingdom of Prussia; it was transferred to Poland as the result of a plebiscite taken in 1921. Pop. (1945 est.) 112,000.

CHOSE, shōz, *in law*, a thing, a chattel, a piece of property; the subject matter of an action. Chose is used in divers senses, of which the four following are the most important: *Chose local*, a thing annexed to a place, as a mill; *chose transitory*, that which is movable, and may be taken away or carried from place to place; *chose in action*, otherwise called *chose in suspense*, a thing of which a man has not the possession or actual enjoyment, but has a right to demand by action or other proceeding; *chose in possession*, a thing which a person has not only the right to enjoy, but also its actual enjoyment.

CHOSEN, chō'sen, name in Japanese for the Asiatic peninsula of Korea (q.v.).

CHOSROES. See KHOSRAU.

CHOU EN-LAI, jō'ēn'li', Chinese Communist leader: b. Huaiyin, Kiangsu Province, 1898. Son of a mandarin family, he was educated in Japan, at Waseda University, and in Tientsin, at Nankai University; for his part in leading a student rebellion in Tientsin in 1919 he served 12 months' imprisonment. He continued his studies in Paris during 1921-1922, and in Germany in 1923, and following his return to China he helped organize the Chinese Communist Party. Joining Sun Yat-sen (q.v.) at Canton in 1924, he became director of political training at Whampoa Military Academy, of which Chiang Kai-shek (q.v.) was the president, and for the next two years, under direction of the Kuomintang, organized Communist strikes in north China. In 1927 he directed seizure of Shanghai by Nationalist forces, but came into conflict with Chiang Kai-shek and narrowly escaped being put to death. From this time Chou was one of the most powerful of the leaders of the Chinese Communists, commanding Red armies which fought first the forces of Chiang Kai-shek and, subsequently, the Japanese invaders of China. Civil war broke out again, however, before Japan had been defeated, and in 1944, Chou was head of a Communist delegation which conferred with Gen. Patrick Jay Hurley in mediation proffered by the United States. In 1946 he was one of the signatories of an agreement designed to terminate the conflict, but fighting once more ensued.

CHOUAN, shwän, member of a band of royalist peasantry of western France, who carried on a petty warfare against the republican government from an early period of the French Revolution. The name Chouan was finally extended to all the Vendéans. The name was derived from the first chief of the Chouans, Jean Cottureau (1757-1794), who with his three brothers organized these bands in 1792, under the inspiration of the Marquis de la Rouerie (see CHARLES TEFFIN ARMAND), an ardent leader of the Royalists. Cottureau was the son and grandson of persons engaged in the manufacture of wooden shoes. He had joined a band of dealers in contraband salt, and acquired the surname Chouan from the cry of the screech owl (*chathuant*), which he used as a signal with his companions. He was killed in an engagement with the Republican troops, July 28, 1794. After the death of Jean Cottureau, the Chouans became quite lawless, engaging in guerrilla warfare and highway robbery. About 1800 they ceased to rob and terrorize, and although an effort was made in 1815 to revive the insurrection, they were suppressed by Gen. Maximilien Lamarque (1770-1832). See also VENDÉE.

CHOUANS, *The*, a romance by Honoré de Balzac (q.v.), the novelist's first important work. The title, when it appeared in 1829, was *The Last Chouan; or, Bretagne in 1800*. In 1846 it was rearranged in its present form. The author made a profound study of the scenery of Bretagne (Brittany) and the manners of its people before he wrote his romance, and his pictures of both scenery and people have the stamp of reality and truth.

CHOUSINGHA, chou'sing-hä, a gazelle-like Indian antelope, remarkable for the fact that

the buck has four horns. See also **FOUR-HORNED ANTELOPE**.

CHOUTEAU, (René) Auguste, cofounder of Saint Louis and fur trader: b. New Orleans, La., September 1749; d. Saint Louis, Feb. 24, 1829. The eldest son of René Auguste Chouteau and Marie Thérèse Bourgeois Chouteau, in August 1763 he left New Orleans for the Illinois Country as clerk to Pierre LaClède, who with others had obtained a grant of the fur trade on the Upper Mississippi. In December LaClède chose for his trading post the site of Saint Louis and later sent 14-year-old Chouteau with 30 men to begin construction (Feb. 15) of the first building. Until 1768 Chouteau continued as assistant to LaClède, thereafter operating as his partner. Following LaClède's death (1778) Chouteau emerged as the citizen of first importance. According to William Henry Harrison (1805) he was "without doubt the first of the Louisianians, Upper, or Lower." Though he held no office he was much consulted by Spanish officials, particularly in regard to the important Osage tribe, whose trade for many years he controlled with his brother Pierre (q.v.). After the transfer of Louisiana he served as judge of the Court of Common Pleas and Quarter Sessions, justice of the peace, president of the first Board of Trustees of St. Louis, member of the legislative council of Missouri Territory, lieutenant colonel of militia, and United States Commissioner for various Indian treaties. He married Marie Thérèse Cerré, by whom he had four sons and three daughters.

CHOUTEAU, shō-tō', Auguste Pierre, fur trader and Indian treaty commissioner: b. Saint Louis, Mo., May 9, 1786; d. Fort Gibson, Okla., Dec. 25, 1838. The eldest son of Pierre Chouteau (q.v.) and Pelagie Kiersereau Chouteau, he was appointed to the United States Military Academy by Thomas Jefferson in 1804 and was graduated on June 20, 1806, fourth in a class of fifteen. He served briefly as ensign in the 2nd Infantry on the southwestern frontier, resigning Jan. 13, 1807, to take his place in the family business. In that year he led a fur trade expedition up the Missouri which was prevented from reaching its destination among the Mandans by the hostility of the Arikaras. Two years later, as a partner in the newly-founded Saint Louis Missouri Fur Company he again ascended the Missouri and wintered in the Dakotas. During the War of 1812 he served as captain of militia. In 1815 with Jules de Mun he led a considerable party of trappers to the Colorado mountains; in the course of this expedition he battled several hundred Pawnees on an island in the Arkansas which has since borne his name. In 1817 Chouteau and De Mun were imprisoned by the Spanish at Santa Fe and their property worth more than \$30,000 was confiscated. Through his father young Chouteau's trading contacts with the Osage had begun soon after he left the army. Now, on his return to Saint Louis, he concentrated on the Osage trade, at first through a resident partner (1817), and presently through posts which he personally supervised, the chief of which were on the Saline and the Neosho rivers (1822), and near the mouth of the Verdigris (1823). During the remainder of his life the United States government as well as the Indians looked on him as the friend and adviser of the tribes near Fort

Gibson. He served frequently as commissioner for Indian treaties and in his last years was employed in negotiating with the Comanches. On an expedition to the Comanche country he had the accident which led to his death. He married his cousin Sophie Labbadie of St. Louis, Feb. 15, 1809, by whom he had one son and six daughters.

JOHN FRANCIS McDERMOTT,
Professor, Department of English, Washington University, St. Louis, Mo.

CHOUTEAU, (Jean) Pierre, fur trader and Indian agent: b. New Orleans, La., Oct. 10, 1758; d. Saint Louis, Mo., July 10, 1849. In September 1764 he arrived with his mother and sisters at Saint Louis where his brother Auguste (q.v.) was then clerk to Pierre LaClède. In 1794 the brothers obtained an exclusive grant of the Osage trade for eight years and Pierre built Fort Carondelet in western Missouri where he commanded with rank of lieutenant of militia. He may have been responsible for the removal of 400 Osage to the Arkansas River in 1802 when the monopoly was given to rival merchants; there is no evidence, however, that he ever maintained a trading post in Oklahoma. In 1804 he was named United States Indian agent for all tribes west of the Mississippi; later he was for years agent for the Osage. In 1809 he organized with others the St. Louis Missouri Fur Company and commanded the expedition which returned Shahaka to the Mandans. He served as captain and major of militia, justice of the peace in St. Louis, and as one of the first trustees of the town. His sons by his first wife were Auguste Pierre (q.v.); Pierre, Jr., eventually head of the American Fur Company; and Paul Ligest, for many years a United States Indian agent. François, eldest son by his second wife, established a trading post on the site of Kansas City in 1821.

CHOWCHOW, chou'chou, **CHOW**, or **CHOW-CHOW**, a diminutive breed of Siberian sledge dogs, improved and developed in China, whence they began to be imported into Europe and America at the beginning of the 20th century. These dogs have the form and coat of their more useful progenitors (dense, straight, rather coarse in texture, with a soft woolly undercoat), and are compact and sturdy of frame. See also **Dog**.

CHOWCHOW, a Chinese or pidgin English word meaning chopped up or broken and mixed. It is applied to a confection of mixed fruits made in China; to a mustard pickle of assorted ingredients made in India; in the United States and Great Britain to a similar pickle usually compounded of chopped cabbage, green tomatoes, green or red peppers, spices, vinegar, mustard seed, and cucumbers.

CHOWDER, chou'dér (French *chaudière*, "kettle"), a dish of French origin, composed chiefly of vegetables, pork, and fish or shell-fish, boiled together. Perhaps the most common form of chowder is that made from clams, either from the soft-shelled variety or the hard-shelled round clam or quahog. Chowder is a favorite dish on the New England coast and among the Newfoundland fishermen. A fish chowder is made as follows: salt pork cut into small strips or dice is cooked for a few minutes in a deep

kettle. Sliced or chopped onions are slightly browned in the pork fat, and onions and pork are then removed. A layer of sliced potatoes is laid in the kettle, then a layer of fish (small ones entire or large fish in slices), a layer of salt pork, one of onions, and so on alternately to the requisite amount. The fried salt pork and onions are also distributed through the mass, which should be seasoned throughout with salt, pepper, thyme, and savory. A very common ingredient is ship bread or other hard crackers laid in between the other layers. A small quantity of water or milk, or of both, is poured into the kettle, and the whole is boiled, without stirring, until cooked through. In adding the water or milk it must be remembered that chowder is a stew, not a soup. Foreign cooks make a soup of clams, potatoes, onions, and tomatoes, which passes under the name of clam chowder. Genuine chowder is never disturbed until it is served, and in camps is portioned out in layers, direct from the kettle.

CHOWN, choun, **Samuel Dwight**, Canadian clergyman: b. Kingston, Ontario, Canada, April 11, 1853; d. Toronto, Jan. 30, 1933. He was educated at Victoria University in Cobourg, Ontario (now at Toronto), which conferred on him the degree of doctor of divinity in 1898. Ordained a Methodist minister in 1879, during the succeeding 25 years he had charge of important congregations in Montreal, Toronto, and other cities. His influence was a major factor in bringing about the union of the Methodist with the Presbyterian and the Congregational churches in 1925, to form the United Church of Canada. On this achievement he based his *Story of Church Union in Canada* (1930).

CHRETIEN DE TROYES (also **CHRESTIEN DE TROYES**), krā-tyān' dē trwā', French poet: b. probably in Champagne, France, about 1130; d. about 1180. A native of northern France, Chrétien was one of the first trouvères to compose in the lyric style of the troubadours of southern France. Among his earlier works, now lost but for some fragments in imitation of Ovid, were adaptations of the classical stories of Thebes, Troy, and Rome. He is chiefly known, however, as one of the first writers to create romantic narrative poems dealing with the knights of King Arthur's Round Table. His five extant Arthurian poems, in chronological order, are: *Erec et Enide*; *Cligès*; *Lancelot or le Roman de la charrette* (sometimes written as *Le Chevalier de la charrette*); *Ivain ou le Chevalier au lion* (sometimes written as *Yvain, ou le Chevalier au lion*); and *Perceval or Conte du Graal*, one of the first literary versions of the legend of the Holy Grail. He is believed to have died before completing this last work. See also **ARTHURIAN ROMANCES**.

Consult Comfort, W. W., *Arthurian Romances and Chrétien de Troyes* (London 1913); Loomis, R. S., *Arthurian Tradition and Chrétien de Troyes* (New York 1949).

CHRISM, krīz'm, a mixture of olive oil with balm, blessed by a bishop and used in the Roman Catholic Church and the Greek Church in the administration of the sacraments of baptism, confirmation, ordination, and extreme unction; and in such rites as the consecration of churches, altars, chalices, and baptismal water. The chrism of the Greek Church is compounded of olive oil and a great variety of spices and perfumes. In the Roman Catholic Church the holy oils are

blessed by a bishop on the Thursday of Holy Week.

CHRISOM, krīz'ūm, the name of the white linen cloth laid by the priest on the child in Roman Catholic baptism in medieval times to signify the child's innocence. The cloth was generally presented by the mother as an offering to the church, but if the child died before the mother was churched, it was used as a shroud. By a common abuse of words, chrisom came to mean the child itself, being first applied in the old bills of mortality to denote such children as died within the month of birth.

CHRIST (from Gr. *Christos*, anointed; equivalent to Hebrew *Māshiah*), the term applied to Jesus of Nazareth as the Messiah (q.v.).

CHRIST, Jesus. See **JESUS CHRIST**.

CHRIST, krīst, **Wilhelm von**, German classical philologist: b. Geisenheim, Hesse-Nassau, Germany, Aug. 2, 1831; d. Munich, Feb. 8, 1906. He was a professor at the University of Munich from 1860 to 1902. His *Geschichte der griechischen Literatur bis auf die Zeit Justinians* (1888; 5th ed. 1908) has long been a standard history of Greek literature. Among his numerous other works are *Metrik der Griechen und Römer* (1879); editions of the *Iliad* (1884); *Pindar* (1887); and the *Poetics* (1878) and *Metaphysics* (1895) of Aristotle.

CHRIST, Disciples of. See **DISCIPLES OF CHRIST**.

CHRIST CHURCH, largest of the 33 colleges, halls, and societies of Oxford University England. In 1524, Thomas Cardinal Wolsey obtained from Pope Clement VII a bull allowing him to convert the monastery of St. Frideswide into a college, to be called Cardinal College which he intended to endow on a magnificent scale. On the fall of Wolsey in 1529, this foundation came into the hands of Henry VIII. In 1532, Henry re-established it under the name of King Henry VIII's College, but again suppressed it in May 1545, and a year and a half later (Nov. 4, 1546) re-established it once more by letters patent under the name of The Cathedral Church of Christ in Oxford of the Foundation of King Henry the Eighth, with a dean and 8 canons, 100 students, 8 chaplains, and clerks, choristers, an organist, and a schoolmaster. He appointed public professors of divinity, Hebrew, and Greek.

The original foundation has been considerably modified since its creation. According to the present statutes, which came into force in 1926, the governing body consists of a dean, who is the dean of the Anglican diocese of Oxford as well as the head of the college; 6 canons (of the cathedral of the diocese; 5 being university professors of theology); and a body of students (equivalent to fellows, that is, teachers, in other colleges). In 1952, there were 51 students, 8 lecturers, 3 chaplains, 14 choristers, and an organist; in that year there were 659 undergraduates.

The original buildings were added to and rebuilt as the college expanded through the 17th and 18th centuries. Dean Henry George Liddell, who introduced the spirit of reform during his term (1855-1891), was responsible for the res-

ration of and further additions to the college buildings. The buildings about the great quadrangle include the cathedral, which is the smallest in England and is also the college chapel, and the hall, which, with the exception of the hall of William II in Westminster Palace, is the best example of its kind in England. Tom Tower, designed by Sir Christopher Wren to hold the bell Great Tom, was erected about 1682 and one of the landmarks of Oxford.

Commonly referred to as "the House" (*Aedes christi*), Christ Church is one of the foremost colleges of Oxford and has always been famous for its distinguished members. Among these may be mentioned several prime ministers of England, including, in the 19th century, George Canning, Sir Robert Peel, William E. Gladstone, Robert Arthur Talbot Gascoyne-Cecil, 3d marquess of Salisbury, Archibald Philip Primrose, 5th earl of Rosebery; and viceroys of India including Charles John Canning (Earl Canning). Other illustrious names connected with the college are Ben Jonson, John Locke, William Penn, John and Charles Wesley, John Ruskin, King Edward VII, and Anthony Eden.

Consult Thompson, H. L., *Christ Church* (London 1900); Hiscock, W. G., *A Christ Church Miscellany* (Oxford 1946); Trevor-Roper, H. R., *Christ Church* (Oxford 1950).

CHRIST IN ART. The representations of the person of the Saviour, which for a succession of ages have constituted one of the most important subjects of Christian art and have occupied the highest genius of Christendom, are all ideal. The attempt to represent the personal appearance of the Saviour probably cannot be traced back farther than the age of Constantine (4th century A.D.). The origin of Christian art has been traced to the catacombs of Rome, and is not to be considered as springing directly from pagan art, although the great Italian masters of the Middle Ages may have derived much instruction from classical models; but the painting and sculpture of the early Christians were chiefly allegorical, representing the moral of the gospel parables or similar symbolic representations of Christian doctrine, without regard to historical accuracy of portraiture. At a later period legends arose that various likenesses of the Saviour had been preserved by miraculous means. For example, King Abgar of Edessa had a napkin sent him by the Saviour himself, in which the Saviour had caused his likeness to be miraculously impressed by placing his face in it. A portrait is said to have been similarly impressed on a handkerchief of St. Veronica, and St. Luke is said to have taken one himself.

One of the earliest professed portraits of the Saviour is in the Catacomb of Callistus near Rome. He is represented with the hair parted on the forehead, and falling over the shoulders in long waving locks. In regard to this common representation it may be observed that when St. Paul wrote his first Epistle to the Corinthians, there were probably many Christians scattered over the world who remembered the personal appearance of the Saviour; therefore, if this representation had been correct, Paul would hardly have written to a Christian church that it was contrary to nature and a shame for a man to have long hair.

The great painters of the Middle Ages, to whom we owe the ideal representation of Christ, probably founded their works somewhat upon these early notions. A Christ of the 4th century

with an oval face, Oriental features, parted hair, and a short straight beard is said to have been the model for the Byzantine and Italian painters until the time of Michelangelo and Raphael.

CHRIST OF THE ANDES, a bronze statue of Christ on the Argentina-Chile border in the Andes, dedicated on March 13, 1904, as a symbol of perpetual peace between the two countries. It was erected jointly by Argentina and Chile on the summit (over 13,000 feet) of the Uspallata (La Cumbre) Pass, between Mendoza, Argentina, and Santiago, Chile, to commemorate the final settlement of a long and bitter boundary dispute which more than once had threatened war. Molded from old Argentine cannon, the statue is the work of the Argentine sculptor Mateo Alonzo (q.v.). The figure of Christ, 26 feet high, stands on a granite hemisphere; the left hand supports a great cross; and the right arm is raised in benediction over the two countries. The inscription in Spanish around the base may be translated: "Sooner shall these mountains crumble into dust than the people of Argentina and Chile break the peace sworn at the feet of Christ the Redeemer."

CHRISTABEL, kris'tà-běł, a poem by Samuel Taylor Coleridge. Though only a fragment, it is, among all his works, second in fame only to *The Rime of the Ancient Mariner*. The first part was written in 1797, the second in 1800; and between them and the date of its publication in 1816—a delay due largely to Coleridge's uncertain ways—Sir Walter Scott, Charles Lamb, William Wordsworth, Robert Southey, and many other people of taste and authority had become familiar admirers of the poem. Except for a certain disappointing harshness in the reviews of the day, this success was repeated in a wider public for the printed form and may be said still to hold.

Christabel for us, then, remains a fragment of a long narrative poem. The second canto leaves off with the baron's anger at his daughter's jealousy and his dispatching Tracy, the bard, to Lord Roland's castle at Tryermaine. It is a common opinion that Coleridge never told how the poem was to end. But in James Gillman's *Life* (p. 301), published in 1838, is supplied an account of Coleridge's plan for its completion in a third and fourth canto, by making the supernatural being change from Geraldine to Christabel's absent lover. Christabel is revolted, without knowing why, by the suit paid her; but she finally yields to her father's entreaties and is led to the altar. The real lover returns just in time with the ring token. The supernatural being disappears, the bell tolls, and the mother's voice is heard, and with joy the marriage and the reconciliations take place.

The metrical beauty of *Christabel* is one of its greatest claims. It is based on the principle of accent, rather than syllable counting. There are four accents to the line, with a variation in syllables as the poetic necessity and passion itself may vary. With so delicate an instrument as this, Coleridge shows himself easily to be one of the great masters of English verse.

The main idea of *Christabel* is that the virtuous people of this world may save the wicked; may have a power deeper far than the power of evil. Around this idea Coleridge weaves the story, with the framework of popular romance and legend; the pure maiden, the mother's love;

the natural-supernatural effect, to use his own phrase; the innumerable lovely cadences; the half-magical imagery; the enchantments; the poignant and lyrical beauty everywhere evident.

STARK YOUNG,
Author and Critic.

CHRISTADELPHIANS, krīs-tā-dēl'fī-āns (also called BROTHERS OF CHRIST), a small body of Christians acknowledging John Thomas (1805-1871), an English-born physician, as their founder. He emigrated to the United States in 1832, and was for a time connected with the Disciples of Christ. In 1834 he opposed the doctrines of that body concerning baptism, and in 1844 announced his belief that the existing churches were apostate; thereupon, he began to form societies which held with him to the Bible as the only rule of faith and practice and to the idea of restoration of primitive Christianity. Several years later, in 1864, the distinctive name of Christadelphians was adopted.

Christadelphians do not accept the conventional view of the Trinity, believing that the Holy Spirit is not a person, but an effluence of divine power. They believe that Christ will come and set up His kingdom in Palestine, and that at the millennium the righteous will receive the reward of eternal life and the wicked will be sentenced to eternal death. They baptize by immersion, and are conscientious objectors to war. There is no ordained ministry. In 1950 there were 115 churches in the United States, with a total membership of 3,755. *The Faith* (formerly *The Christadelphian Advocate*), published in Waterloo, Iowa, is their organ.

Consult Roberts, R., *Meaning of the Christadelphian Movement* (London 1872) and Dr. Thomas, *His Life and Work* (London 1884).

CHRISTCHURCH, kris[t]l'chūrch, parliamentary and municipal borough, England, situated in Hampshire (officially Southampton) about 25 miles west-southwest of Southampton and at the confluence of the Avon and Stour rivers, about one mile from the English Channel. It is famous for its great Augustinian priory church, dating in part from the 11th century. There are also the 12th-century Norman House and the remains of a castle of the same period. The church is over 300 feet long and contains a magnificent altarscreen. The famous south coast health resort, Bournemouth, is nearby. Pop. (1951) 20,506.

CHRISTCHURCH, city, New Zealand, capital of the Province of Canterbury, located on the east coast of South Island. The see of the primate of New Zealand, it is situated on the Avon River, seven miles from the South Pacific Ocean, and is the terminus of the Great Northern and Southern Railway. A railway tunneled through the Lyttleton Hills connects it with Lyttleton, the nearest port. It was founded by the Canterbury Association, a colonizing body of Anglican churchmen formed in 1850, and its streets were given the names of English dioceses.

It is one of the two chief centers of South Island, surrounded by the fertile Canterbury plain, an important grain and dairy region. The chief industries are tanning and meat packing. Socially it is one of the principal cities of New Zealand. Its seaside resort, New Brighton, is famous throughout the island. Christchurch con-

tains a number of handsome buildings, including a Roman Catholic and an Anglican cathedral, the government offices, Saint Michael's Church, the Supreme Court, museum, library, Canterbury University College (founded 1873), Christ's College, the McDougall Art Gallery, and a school of arts. The city celebrated its centenary in 1950 with a great pageant and games. Christchurch is the birthplace of the famous opera singer, Frances Alda. Pop. (1951) 112,681; metropolitan pop. 150,047.

CHRISTIAN, krīs'chăn; krīst'yăn, the name of 10 kings who ruled in one or more of the Scandinavian countries of Denmark, Norway, Sweden, and Iceland. The periods and nations of their reigns follow:

CHRISTIAN I, 1448-1481—Denmark, Norway, Sweden (Sweden 1457-1471); CHRISTIAN II, 1513-1523—Denmark, Norway, Sweden (Sweden 1520-1523; Denmark and Sweden separated 1523); CHRISTIAN III, 1534-1559—Denmark and Norway; CHRISTIAN IV, 1588-1648—Denmark and Norway; CHRISTIAN V, 1670-1699—Denmark and Norway; CHRISTIAN VI, 1730-1746—Denmark and Norway; CHRISTIAN VII, 1766-1808—Denmark and Norway; CHRISTIAN VIII, 1839-1848—Denmark (and Norway briefly, 1814); CHRISTIAN IX, 1863-1906—Denmark; CHRISTIAN X, 1912-1927—Denmark and Iceland (Iceland as a separate kingdom, 1918-1944).

CHRISTIAN I, king of Denmark, Norway, and Sweden: b. 1426; d. Copenhagen, Denmark, May 21, 1481. The son of Theodoric, count of Oldenburg, he was the founder of the Oldenburg dynasty of Danish kings. The Union of Kalmar, which united the kingship of Denmark, Norway, and Sweden, was practically dissolved when Christian came to the throne in 1448. He united Norway and Denmark in 1450 and seized Sweden in 1457, but his efforts to subdue Sweden ended with his defeat by Sten Sture (the elder) at Brunkeberg, near Stockholm, in 1471. He united Schleswig and Holstein with the Danish crown in 1460 and founded the University of Copenhagen in 1479. He was succeeded by his son John.

CHRISTIAN II, king of Denmark, Norway, and Sweden: b. Nyborg, Denmark, July 1, 1481; d. Kalundborg, Denmark, Jan. 25, 1559. He succeeded his father, King John, as king of Denmark and Norway in 1513. In 1515, to strengthen himself against Sten Sture (the younger), administrator of Sweden, he married Isabella, sister of Emperor Charles V. Christian incurred the hatred of the Danish nobles by enacting reforms in favor of the lower and middle classes and by allowing his Dutch mistress Dyveke and her mother to wield great influence in the administration and finances of the realm.

After several unsuccessful attempts, he asserted his claim to Sweden by arms in 1520. His wholesale massacre of Swedish nobles after his victory won him the appellation "the Cruel." In 1521, the Swedes revolted under Gustaf Vasa, whom they proclaimed king of Sweden as Gustavus I in 1523, thus ending the Union of Kalmar.

Late in 1522, the Danish nobles, resentful of the new code of laws modeled on the Dutch system, deposed Christian, drove him out of Denmark, and called his uncle Frederick to the throne. After remaining in exile for over eight years, Christian tried to recover his kingdoms and proclaimed himself king of Norway at Oslo on

Nov. 29, 1531. Hoping to negotiate with Frederick, he returned to Copenhagen. But Frederick imprisoned him, first at Sønderborg Castle, later at Kalundborg Castle, where he died.

CHRISTIAN III, king of Denmark and Norway: b. Gottorp, Denmark, Aug. 12, 1503; d. Kolding, Denmark, Jan. 1, 1559. He was chosen king in 1534, a year after the death of his father, Frederick I. An ardent Lutheran, he established the Reformation in Denmark in 1536. His attempts to reduce Norway to the status of a province were not permanently successful, but his rule did much to strengthen Denmark. He was succeeded by his son, Frederick II.

CHRISTIAN IV, king of Denmark and Norway: b. Frederiksborg, Denmark, April 12, 1577; d. Copenhagen, Feb. 28, 1648. He succeeded his father, Frederick II, as a minor in 1588. After assuming personal rule in 1596, Christian laid the foundation of the Danish Navy and developed the country's industry and commerce. In consequence of the claims advanced by Sweden to Lapland in 1611, he became engaged in the Kalmar War with Charles IX of Sweden and his successor, Gustavus Adolphus, but terminated it in 1613 by an advantageous peace, by which he gained free navigation for Denmark in the Baltic. He rebuilt Oslo in 1624 and renamed it Christiania.

Persuaded by England, France, and the Netherlands to join the Protestant cause in the Thirty Years' War, he was defeated by Johan Tserclaes, count of Tilly, general of the Catholic League, at Lutter am Barenberge in 1626. War with Sweden broke out again in 1643, in which Christian was defeated and forced to yield some of his Norwegian territory.

During his reign, Christian extended the trade of his subjects to the East Indies, introduced a judicious system of finance, and fitted out several expeditions for the discovery of a northwest passage. His court was the scene of a brilliant intellectual and artistic life. He was succeeded by his son, Frederick III.

CHRISTIAN V, king of Denmark and Norway: b. Flensburg (now in Germany), Denmark, April 15, 1646; d. Copenhagen, Aug. 25, 1699. He succeeded his father, Frederick III, in 1670. Guided by his chancellor, Count Peder Schumacher Griffenfeld, he attempted to create a new nobility from the lower orders. He waged a fruitless war with Sweden from 1675 to 1679. He was succeeded by his son, Frederick IV.

CHRISTIAN VI, king of Denmark and Norway: b. Copenhagen, Denmark, Nov. 30, 1699; d. Aug. 6, 1746. He succeeded his father, Frederick IV, in 1730. An extravagant king, he built many costly buildings, following the whims of his wife. He was succeeded by his son, Frederick V.

CHRISTIAN VII, king of Denmark and Norway: b. Copenhagen, Denmark, Jan. 29, 1749; d. Rendsburg, Denmark, March 13, 1808. He succeeded his father, Frederick V, in 1766 and, in the same year, married Caroline Matilda, sister of George III of England. He afterward traveled for three years in England, Germany, Holland, and France and became a member of several learned academies. Youthful indulgences, however, had weakened his intellect and obliged him to confide the charge of public business to his ministers, notably Count Johann Hartwig Ernst von Bernstorff and Count Johann Friedrich von Struensee, court physician. The latter, whose innovations provoked the hostility both of

the nobility and the army, was forced out of office by a conspiracy of nobles, largely because of his involvement in a scandal concerning the queen. Struensee and the queen were arrested in 1772, the queen divorced, and Struensee beheaded. The important improvements which took place during Christian's reign—the abolition of serfdom in the duchies, the inauguration of a public health program, and the promotion of trade and commerce—were the work of Count von Bernstorff. Christian became hopelessly insane and yielded control in 1784 to his son, Frederick, who ruled as regent and later became Frederick VI.

CHRISTIAN VIII, king of Denmark and of Norway for a short period: b. Copenhagen, Denmark, Sept. 18, 1786; d. there, Jan. 20, 1848. He was the nephew of Christian VII. In May 1814, while Frederick VI was ruling Denmark as regent, the Norwegians elected Prince Christian king of Norway, but, unable to hold it against Crown Prince Jean Baptiste Jules Bernadotte of Sweden, Christian was driven out of Norway in October of the same year. He became king of Denmark in 1839. The most important event of his reign was his proclamation in 1846 that Schleswig and Holstein were inseparably united to Denmark. He was succeeded by his son, Frederick VII.

CHRISTIAN IX, king of Denmark: b. Gottorp, Denmark, April 18, 1818; d. Copenhagen, Jan. 29, 1906. He was the fourth son of William, duke of Schleswig-Holstein-Sonderburg Glücksburg and succeeded Frederick VIII on Nov. 15, 1863. On the accession he immediately encountered difficulties. Frederick VIII, duke of Schleswig-Holstein-Sonderburg-Augustenburg, son of Christian Augustus, laid claim to the duchies of Schleswig and Holstein, although his father's rights had been bought out in 1852. The intervention of Prussia and Austria (1864) wrested the duchies from Denmark after a short war and Christian was compelled to renounce all his rights over them.

The remaining 40 years of Christian's reign were uneventful except for the continual turmoil of domestic politics. But if the country over which he ruled was small and comparatively unimportant, the members of his family certainly filled exalted positions. He married, in 1842, Princess Louise (1817–1898), daughter of the landgrave William of Hesse-Cassel. Of their six children, one son became king of Denmark (Frederick VIII); another, king of Greece (George I); one daughter, Dagmar, became empress of Russia as wife of Alexander III; while the other, Alexandra, as Edward VII's wife, became queen of England. A grandson, brother of Christian X, became Norway's Haakon VII.

CHRISTIAN X (CARL FREDERICK ALBERT ALEXANDER VILHELM), king of Denmark and Iceland: b. Charlottenlund Castle, near Copenhagen, Denmark, Sept. 26, 1870; d. Copenhagen, April 20, 1947. The son of Frederick VIII and Queen Louisa, and elder brother of Haakon VII of Norway, he married Alexandrine Augustine, duchess of Mecklenburg-Schwerin, on April 26, 1898, and succeeded to the throne May 14, 1912. In 1915, he granted a new constitution, which included the enfranchisement of women. During the German occupation of World War II, he chose to remain under house arrest until Denmark's liberation by British troops in 1945 and became a symbol of national resistance. In 1944, Iceland (united with Denmark in 1918

as a sovereign state under a single king bearing the title of King of Iceland and Denmark) decided by a referendum to sever all ties with the Danish crown. Six feet seven inches in stature, Christian was the tallest of European monarchs. He was succeeded by his son, Frederick IX.

CHRISTIAN I (COUNT CHRISTIAN VON BUCH), German prelate, imperial chancellor, diplomat, and soldier, one of the most picturesque figures of the Middle Ages: b. 1165; d. Tusculum, Italy, Aug. 25, 1183. He was made archbishop of Mainz in 1165. He was chiefly celebrated for his military exploits under Frederick I (Frederick Barbarossa), for whom he opened the way to Italy. After siding with the emperor against Pope Alexander III, whom he defeated in 1167, he later persuaded the emperor to make peace with Alexander and from then on protected him. He died of fever after scaring a hostile Roman army away from the walls of Tusculum, where he had gone in response to an appeal from Pope Lucius III.

CHRISTIAN, The, a novel by Hall Caine, published in England in 1897. For the most part the scene is laid in the London of the day. The character of the title is a clergyman whose faith and resolution are broken by his love for a music-hall singer and actress.

CHRISTIAN AND MISSIONARY ALLIANCE, the title adopted when the Christian Alliance (founded in New York City in 1887 by the Canadian-born minister, Albert Benjamin Simpson) combined with the International Missionary Alliance in 1897. It is an evangelical missionary movement, stressing "the deeper Christian life and consecration to the Lord's service." There are missions in many countries, and in the United States there were 928 churches in 1953, with a total membership of 56,097. *Alliance Weekly* (New York) is its organ.

CHRISTIAN ARCHAEOLOGY, the scientific study of the material remains of early Christian times. Since it was in the Mediterranean world that Christianity originated and first spread, the investigation is primarily concerned with that region and particularly with the lands of Palestine, Asia Minor, Greece, Italy, and Egypt. Interest in the sacred sites of Palestine arose at least as early as the time of Constantine I (r. 306–337 A.D.). According to Eusebius of Caesarea, writing in the same period, the first Christian emperor ordered the demolition of a pagan temple which had been built at the place of the resurrection of Christ, and when the polluted surface soil was removed, the original tomb of the Saviour came to light. Through the beneficence of Constantine a beautiful basilica was then erected to mark the site. At about the same time, the Holy Land was visited by the emperor's mother, Helena, who dedicated a church at Bethlehem at the grotto where Jesus was born, as Eusebius also states. In 333 A.D., an anonymous pilgrim from Bordeaux, France, traveled in Palestine and mentioned both of these churches, as well as other sacred sites, in the account of his journey. Eusebius himself wrote a work *On the Names of Places in the Holy Scriptures*, giving an alphabetical list of Biblical place names, and later pilgrims

like Theodosius (about 530 A.D.) also visited many places in Palestine connected with the life of Jesus and left records of their itineraries which contain clues for the identification of sites.

In contrast with the observations of such early visitors, modern scientific work in Palestinian archaeology is usually considered to have been begun by Professor Edward Robinson of Union Theological Seminary in New York City on his journeys in the Holy Land in 1838 and 1852. Of the large number of actual excavations which have now been conducted in Palestine, the majority have to do with Old Testament rather than New Testament sites. Bethlehem, Nazareth, and Jerusalem are still densely populated towns and therefore exploration is difficult. Nevertheless not only have the earliest portions of the Church of the Nativity at Bethlehem and the Church of the Holy Sepulcher at Jerusalem been studied, but also some of the 1st century walls of Jerusalem have been traced; the pool of Bethesda (or Bethzatha) has been located near the present Church of St. Anne; and a pavement which may be that which was called Gabbatha has been found beneath a modern convent at the corner of the ancient temple area. Capernaum has been located at Tell Hüm on the Sea of Galilee and the synagogue there excavated and partially restored; the ruins are, however, probably of somewhat later date than the time of Jesus. Samaria, known in New Testament times as Sebaste (now Sebastye) in honor of the Emperor Augustus, has been excavated; so too has New Testament Jericho, winter capital of the Herods, some distance removed from the Old Testament city of the same name. Actual relics of the life of Jesus would be welcome finds, but no objects which have thus far come to light, including the famous Chalice of Antioch, supposed by some to have been the Cup of the Last Supper, have commanded the unanimous assent of experts as to authenticity.

When William M. Ramsay began his explorations in Phrygia in Asia Minor in 1880, there was no trustworthy map of that region, and so little interest did he himself have in Christian antiquities that he considered the time wasted which he spent in copying Christian inscriptions; yet ultimately his work cast a flood of light upon the travels of the Apostle Paul, and he himself became a strong believer in the trustworthiness of the Acts of the Apostles in the New Testament. The most extensive excavations in Asia Minor have been at Ephesus, where the agora, the theater, and also the Temple of Artemis, one of the Seven Wonders of the World, have been found. Work in Macedonia and Greece has been the province of classical archaeologists, yet has resulted in not a few finds of interest from the point of view of the New Testament. At Philippi a gate has been found probably to be identified with that mentioned in Acts 14:13. At Athens the Areopagus or Hill of Ares (Mars' Hill), where the Areopagus court probably met, is well known. At Corinth there is an inscription mentioning an Erastus who may be the same person as the friend of Paul named in Romans 16:23.

Discovery of the Christian catacombs at Rome came by accident in 1578; the pioneer in their investigation was Antonio Bosio, whose posthumous *Roma Sotterranea* was published in 1632. In the 19th and 20th centuries exploration was continued by the de Rossi brothers, Joseph Wilpert, Orazio Marucchi, and Paul

Styger. According to Styger's results, the oldest catacombs date from the middle of the 2d century. Adorned with paintings which utilize unobjectionable pagan motifs, Old Testament scenes, and New Testament happenings, the catacombs provide much material for an understanding of the thought world of the early Christians, and especially of their belief in salvation and the everlasting life.

A major contribution of Egypt has been the preservation in its dry sands of large quantities of ancient documents written on papyrus. These include many records and letters which reveal the character of daily life in the 1st century A.D. They are written in a kind of everyday Greek, known as *koine*, which is similar in many ways to that found in the New Testament. Among the papyri has been found a codex or book containing the church letters of the Apostle Paul which probably dates from around 200 A.D. and thus is by far the oldest manuscript of a substantial part of the New Testament which is now known.

The study of yet other subjects, including early Christian sarcophagi, churches, and mosaics, belongs to the field of Christian archaeology. As research continues, further discoveries may be made at any time, and thus the science of Christian archaeology continues to be of great interest and importance.

Professor of New Testament Literature and Interpretation, Pacific School of Religion, Berkeley, California.

CHRISTIAN CHURCH, The, a term used in a broad and comprehensive sense to include all religious bodies which worship Christ as divine or revere him as a great religious teacher and example, and wish to be called by his name. Some of these denominations assert an exclusive claim to be considered the one and only Christian church. The three main divisions are: (1) the Roman Catholic Church or Church of Rome; (2) the Eastern Orthodox churches; (3) the Protestant churches. The division of the Roman Empire into Eastern and Western empires led to a similar division of the church which, however, did not become final until the 11th century. Schisms in Western Christendom, commencing in the 12th century, culminated in the early 16th century in the Protestant Reformation, which gave birth to the Protestant churches. Of these there are numerous denominations including the Lutheran, Reformed, Presbyterian, Anglican (including Protestant Episcopal), Methodist (of Anglican origin), Baptist, Congregationalist, Friends (Quakers), Universalist, and Adventist. See also **CHRISTIANITY**; **CHURCH**.

CHRISTIAN CHURCH ARCHITECTURE has always been the architecture of its time and place as applied to the specific needs of the church. Its story began in 313 with the recognition of Christianity by Constantine I. Prior to that time the Christian congregations

had gathered for worship in the homes of their members. Probably both the house and other Roman building types suggested elements of the Early Christian Roman basilica (q.v.). In any case, one first entered the atrium, a courtyard open to the sky and surrounded by covered walks. In its center was the baptismal font on the axis of the church, where it would remain under a separate building long after the atrium had disappeared. Those who had not yet been baptized could enter only the atrium. Within the church a central aisle or nave flanked by two, or in the largest churches by four, side aisles provided ample space for the laity. A transverse member, the bema or transept, terminated the nave and provided space for the lower clergy, while beyond that on the axis of the nave a semicircular apse surrounded with seats for the higher clergy concluded the design. As the number of the clergy increased, partly because of the clerical exemption from taxation, the space reserved for them was sometimes allowed to encroach upon the nave. The altar, near the entrance to the apse, was the religious and architectural focus of the building. In the earliest churches, it was placed over the grave of the saint to whom the church was dedicated or perhaps on the site of his martyrdom, but as the countryside around Rome became unsafe, the bones of the saints were moved and reinterred below the altars. A canopy or baldachino over the altar at once emphasized its sanctity and isolated it within the church. At first the priest, celebrating Mass, stood behind the altar at the west end of the church and looked over it to the congregation, but during the 5th century this custom changed. To enable both the priest and the laity to face east, the altar was moved to the east end of the church so that the celebrant stood between the altar and the congregation. So universal was this custom of orientation that for 1,000 years or more hardly a church failed to have its entrance at the west end and its main altar at the east. The orientation, atrium, nave and aisles, transepts, and apse so well met the needs of early Christian worship that the form remained unchanged in Rome for centuries. For a further description of the basilica, see the general article, **ARCHITECTURE—Early Christian**.

FIG. 1. Byzantine church, plan.

The customs of the church in the Byzantine Empire required separation of the altar from the laity. Hence in Byzantine architecture (q.v.), the altar was placed in an apse or chancel screened from the congregation. Such a chancel was flanked by the prothesis, where the bread and wine were prepared for the Eucharist, and by the diaconicon or vestry.

When western Europe began in the 11th and 12th centuries to recover economically and otherwise from the effects of the barbarian invasions, new forms of church architecture developed to meet new religious conditions. These were first, Romanesque architecture (q.v.), and then in the late 12th to 15th centuries Gothic architecture (q.v.). By the Romanesque period, monasticism had flowered, and such orders as the Benedictine, the Cistercian, and the Cluniac wielded great power and influence. Since the monks were often expected to celebrate the Mass daily, a single altar no longer sufficed. Moreover, the veneration of relics had grown apace, and each relic required its own altar. Hence, in addition to the high altar used for the major services, additional altars necessitated chapels (apsidioles) radiating from the apse or extended from the east walls of the transepts. An ambulatory or curved aisle surrounded the apse to give access to the apsidioles. The services were enriched with sumptuous processions that formed a substantial part of the service and that wound their way from the choir in front of the apse, enlarged to house the monks and clergy, through the ambulatory, the transepts, the aisles, perhaps also through the monastic cloisters, and back again to the choir. Thus the several parts of the great Romanesque and Gothic churches had different roles to play in the liturgy, and in fact the nave for the laity was often screened from the clergy's choir.

With the advent of Protestantism and its spread through many countries of northern Europe, a different type of church was needed. First, the congregations took a more active part in the services and therefore had to be brought closer to the minister. Second, the elaborate ceremonial, identified with popery and monasticism in the minds of Protestants, was abandoned; and third, the sermon gained in importance relative to the Eucharist. Inevitably, with the suppression of monasticism, the cloister disappeared. Multiple altars vanished with veneration of relics and without them the ambulatory lost its reason for existence. The apse and the long choir for the numerous clergy shrank to a shallow chancel or in extreme cases to none at all, so that the altar became simply the Lord's table placed almost or quite within the congregational area. The mystical aspects of the medieval church and worship had given way to the New England meeting-house.

Although there had been great preachers in the Middle Ages, such as Peter the Hermit who launched the first crusade in 1096, the complexity and forms of medieval churches were not designed primarily for sermons. With the Reformation, the sermon came to play a significant and often a dominant role in the Protestant Church, and likewise in the Roman Catholic Church during the Counter Reformation. For the sermon to be effective, the congregation must be able to see the preacher and to hear him clearly. Many of the congregation, if scattered through the long nave, the aisles, and the transepts of medieval churches,

FIG. 2. Church of Catholic Counter Reformation plan. (Il Gesù, Rome.)

were disadvantageously placed for these purposes. Hence in the Jesuit churches in Rome, the nave widened, lateral chapels replaced the aisles, the transepts became shallow chapels, and the entire seating capacity came into proximity to the pulpit. So also in the Protestant churches, the wide nave, the slender colonnades, and the galleries above the aisles enabled virtually all members of the congregation to hear and see the preacher.

The Oxford movement, beginning in 1833, attempted and in large measure succeeded in revivi-

FIG. 3. Influence of Oxford Movement, plan. (St. Paul's, Buffalo, N.Y.)

ing the Church of England by a partial return to the sacramental worship and liturgy of the Middle Ages. Since that ritual had, at least in part, shaped the medieval churches, it followed that the forms of Gothic architecture would be revived also. The renewed emphasis on the Mass demanded the location of the altar in a deep, not a shallow, chancel to emphasize its sanctity, though neither the full complexities of the medieval church nor its complete liturgy could be restored.

Toward the end of the 19th century and in the 20th, still further changes in Christian church architecture have become apparent. While the medieval church played a more universal role in the lives of the people than perhaps do any of the churches of today, the latter have assumed certain specialized social functions or activities. The Sunday school, a peculiarly American innovation, the ladies' guilds or auxiliaries, and the men's clubs meeting as much for social as for religious reasons, and the business offices of the ministers or clergy and their staffs all require church or parish houses nearly if not quite as large as the church proper. In the latter, the aisles have diminished to passageways for access to the seats in a broad nave, since the sermon still plays an important part in most services. In Baptist churches the piscina, in Presbyterian churches the presbyters' chairs will ordinarily assume the place occupied by the altar in Episcopalian and Catholic churches. Thus the arrangement of Christian church architecture through the ages has faithfully reflected the changes in the liturgy and functions of the several churches, and as these functions continue to be modified, so will the buildings be adapted to them.

CHRISTIAN DOCTRINE, Development of. The application of the principle of development to the history of Christian doctrine is modern. Although anticipated earlier, especially by the Father of the History of Dogma, the French Jesuit Denys Petau (Dionysius Petavius, 1583-1652), the full acceptance of the theory came in the 19th century. John Henry (later Cardinal) Newman's famous book, *The Development of Christian Doctrine*, appeared in 1845. The great German histories of dogma came later—those of Adolf von Harnack, 1886-1890; Friedrich Loofs, 1889; and Reinhold Seeberg, 1895-1898. The famous French work by Joseph Tixeront appeared in 1904-1911. Inspired by these modern studies, a vast flood of literature on the subject has appeared since 1880, and the principle is now taken for granted by almost all writers on Christian doctrine. The change in point of view has paralleled the application of the same principle to historical studies generally, to literature, philosophy, art, social history, politics, and the sciences. Everyone now writes history "genetically," that is, by tracing the stages of growth from origin to later condition, and by relating the stages of growth in causal succession. It is not always possible to carry out this principle in detail; and to trace a development is not always to explain, or to assess values. Further, there are too many mysterious and unaccountable variants in human history, too many fresh emergents, due to human

genius or other causes, to make possible the demonstration of any purely mechanical course of development—as if all factors were fully known, thoroughly understood, and therefore predictable.

Despite these limitations, this modern method is far superior to the older type of presentation, in which Christian doctrine (or any particular doctrine) was pictured as a monolithic and unchanging deposit of divine truth, variously apprehended by different minds and in different generations, but essentially unaltered and unalterable. In the patristic and medieval periods, during the Reformation and Counter Reformation, throughout the age of Protestant Scholasticism, and down to the middle of the 19th century, the ancient static view prevailed. The variations seen in the presentation of various doctrines, at different times, were simply the result of changing emphasis: one age needed more emphasis upon one doctrine, or aspect of a doctrine, another upon some other; the church, exercising due "economy" (Greek for stewardship), provided from her treasure "things new and old" (Matthew 13:52), and thus achieved the proper "education of the nations" and the "discipline of souls" committed to her care.

But development goes much farther than mere emphasis. The on-going course of history has itself contributed to the development. There are certain doctrines which still remain in their pristine state, having never been challenged, debated, or defined. Others are highly complex, the result of much debate, and require careful study and expert handling for their full elucidation. Some are of primary importance (that is, the doctrines "necessary to salvation"); others are secondary and inferential (that is, as based upon the primary ones); still others are simply "pious opinions" (that is, based upon devotional considerations, bare probability, or congruence with major doctrines). For "doctrine" (Latin *doctrina*) means "teaching," in this case the teaching of the church. Back of it, underlying it, is the Christian faith; supporting and accompanying it, as its proper medium, is the Christian experience, a social phenomenon seen in common worship, common ideas, and a common terminology. Some doctrines have come in time to be authoritatively defined, as by the ecumenical councils (at Nicaea, 325 A.D.; Constantinople, 381; Ephesus, 431; Chalcedon, 451). Such authoritatively defined doctrines are technically termed dogmas and are usually associated with the creeds promulgated by the ecumenical councils. (See also **CHRISTOLOGY**; **CREEDS AND CONFESSIONS**; **INCARNATION**.) The relation of Holy Scripture to doctrine, including creeds and dogmas, is variously explained.

Protestantism, as a rule, claims to derive its doctrine wholly from the Bible; on the other hand, the Roman Catholic and the Eastern Orthodox churches and many Anglican theologians recognize the authority of ecclesiastical tradition, either as an authority parallel to the Scripture and somewhat independent of it, or as the expression of the continuous activity of study, teaching, and exposition of Scripture within the church. All Christians would probably agree that Holy Scripture is the source of Christian doctrine in one sense or the other: namely, either (1) as the inspired, authoritative record of divine revelation, the permanent medium of the revelation, and therefore the real source of Christian doctrine; or (2) as the authoritative documentation of the church's faith and teaching, that is, doctrine, in the earliest or "classical" period of its history;

accordingly, all later formulations of doctrine must be brought to the test of agreement with these "original documents of the Christian faith." Hence the church cannot "enforce any thing to be believed for necessity of Salvation" unless it is so set forth in Scripture (Thirty-nine Articles, Art. XX).

The earliest stage in the development of doctrine was the apostolic age. After the brief ministry of Jesus in Galilee and Jerusalem, and his death and resurrection, the company of his followers grew rapidly and spread over the whole Mediterranean world including the Near East. At first it was an "eschatological community" gathered together to await the "last things," namely, the return of Christ to hold the Last Judgment, the resurrection of the dead, and the inauguration of the Kingdom of God here upon earth in lieu of the present evil order. The church was simply the body of Jesus' followers who still looked upon themselves as members of the Jewish Covenant, but they gradually came to consider themselves the New Israel, or the True Israel; and as tension mounted, largely as a result of conflict or controversy over the observance of the Jewish law and belief in the Messiahship of Jesus, the Christian church and the Jewish synagogue became separated and have so remained ever since. At this early stage, the doctrines (that is, teachings) chiefly emphasized were: the Messiahship of Jesus; his imminent return; the Resurrection and the Judgment; the reality of Christ's invisible presence with the church, especially in the services of worship; the reality and significance of the "outpouring" of the Holy Spirit, which was also viewed eschatologically, as a sign of the arrival of "the latter days." These are accordingly the doctrines most strongly emphasized in the oldest parts of the New Testament.

Before long, the church came into close contact with Greek, or Hellenistic, religious thought and popular philosophy, and was forced to deal with problems and to answer questions as they arose in the new environment—questions which either had not arisen or had not been so pressing in the world of Jewish Palestine, where Christianity arose: the existence of God, His providence, His justice, His care for mankind, His purposes, the universality of sin and the problem of its removal, the reality of divine grace, the fate of the unbaptized or of the unrepentant or of the grossly wicked, the essential nature of Christ and his relation to the Father. Some of these questions—and their answers—had indeed been at least suggested in the earlier stage; many of them were destined to vex the church for centuries to come. The main problems arose from the changed environment; the religious presuppositions of the pagan world were quite different from those of the old Jewish homeland, with its self-revealed Creator God, His Law, His Covenant, His emissaries the prophets, and finally His Messiah, and the coming Judgment and Kingdom. The church found the answers to these and other questions (1) in the Old Testament, the Greek translation of which (see SEPTUAGINT) the Christian church took over from the Hellenistic or Greek-speaking Jews; (2) in the teaching of Jesus and the apostles, that is, in the church's tradition; and (3) in the living daily experience of Christians, for whom God, Christ, the Holy Spirit, and the invisible world, the grace of sacraments, answers to prayer, and the life to come were simple reali-

ties, not intellectual abstractions or theological categories. The patterns of thought, the terminology, the logical procedures required for the expression of these convictions were found ready to hand in the current philosophies of the late classical period—the fruit of centuries of intellectual toil, chiefly Stoic, Platonic, Peripatetic, and Neo-Platonic.

Out of the successive crises of the conflict with Gnosticism (2d century) and the Arian heresy (4th-5th century) emerged the massive, basically Christological system of doctrine and dogma which has been the central heritage of all Christians ever since. In the medieval period other interests engaged the church, due partly to a total change in the general outlook of European society, a different political creed (feudalism), the survival of Platonic and Neo-Platonic realism in philosophy, and finally (early in the 13th century) the arrival in the West of further logical treatises by Aristotle. Thereupon arose a whole series of new problems: the nature of the atonement; transubstantiation (the mode of Christ's real presence in the Eucharistic species); the sacraments (such considerations as their number, form, matter); the relation of reason to revelation, of faith to knowledge. The great medieval schools were the centers of debate and attempted formulation; the Schoolmen took the whole of Christian theology, that is, the thought-out, philosophically formulated expression of doctrine, as their rightful field of research and definition. With varying emphases, the formulas of the Protestant confessions (Anglican, Lutheran, and Reformed) and, on the Roman side, of the canons, decrees, and catechism of the Council of Trent gave final and authoritative expression to the whole body of medieval Christian doctrine—each, of course, with its own distinctive emphasis.

Since the 16th century, there has been no major change in the content or structure of Christian doctrine, but only a sharpening of definition on minor, sometimes warmly contested points (as in the Roman Catholic Church the definitions of the doctrines of the infallibility of the pope, the Immaculate Conception, and the Assumption of the Blessed Virgin). What chiefly characterizes the period since 1600 is the emergence of historical and literary criticism of the Bible, of church history, and of Christian doctrines, and the consequent reactions, positive or negative, to historical research and the acceptance or rejection of its results. At the present day the Neo-Orthodox movement represents an attempt to find a permanently valid body of Christian doctrine in spite of—or in the midst of—the fluctuating changes in modern historical criticism, especially of the Bible. As Modernism, about 1910, extended its influence far beyond the borders of the Roman Church, so Neo-Orthodoxy, reacting against it 40 years later, has extended its influence far beyond the borders of Protestantism.

CHRISTIAN ENDEAVOR, Young People's Society of. See INTERNATIONAL SOCIETY OF CHRISTIAN ENDEAVOR.

CHRISTIAN ERA, the era or epoch introduced by the birth of Christ. It was calculated in about the year 532 A.D. by a monk, Dionysius Exiguus, a resident of Syria. It is thought that he fixed the advent too late by four years, and that consequently Jesus was born, if the contradiction in terms can be permitted, in 4 B.C.—the generally accepted date among Biblical scholars. They give the "probable dates" as follows: c.4 B.C.—birth of Jesus; c.28-29 A.D.—beginning of his public work; 30 A.D.—death of Jesus. There is no historical data for determining the day of his birth; the church after much vacillation finally settled on December 25. The Christian Era is sometimes called the Dionysian period. See also *CHRONOLOGY—The Christian Era*.

CHRISTIAN FLAG, the flag sometimes displayed in churches as a symbol of Christian worship. Though recognized only by usage and not by the official sanction of any ecclesiastical body, the flag designed by Charles C. Overton in 1897 for the Brighton Chapel, Coney Island, N. Y., has been described by the Federal Council of Churches of Christ in America as "the form most generally regarded." This is "a white rectangle with a blue rectangular field in the upper corner at the mast side containing a red Latin cross." However, many churches, such as the Protestant Episcopal, employ variant designs.

CHRISTIAN KNOWLEDGE, Society for the Promotion of. The oldest and greatest of the religious associations connected with the Church of England. It was founded in 1698, although it did not receive its present name until 1701, and had for its objects: (1) to promote and encourage the erection of charity schools in England and Wales; (2) to disperse, both at home and abroad, Bibles and tracts of religion; (3) in general, to advance the honor of God and the good of mankind by promoting Christian knowledge, both at home and in other parts of the world, by the best methods that should offer. It has continued to pursue these objects, directing its efforts chiefly to Great Britain and the colonies and Commonwealth. It partakes at the same time of the nature of an educational association, a missionary society, a Bible and religious tract society, and an emigrants' spiritual aid society.

The Protestant missionaries who labored in the south of India in the 18th century were supported chiefly by this society, and it is now mainly engaged in supplying to the mission field throughout the world religious literature in the vernacular. Besides translations of the Bible and the Book of Common Prayer, it provides grammars, dictionaries, reading books, and general literature for pioneer missionaries to instruct them in the languages which they will have to use. In Scotland a similar society was organized in the year 1709.

CHRISTIAN OF SCHLESWIG-HOLSTEIN, *shlās'vīk* [*shlēs'-*] -hōl'shtīn; Angl. hōl'stīn, PRINCE (in full **FREDERICK CHRISTIAN CHARLES AUGUSTUS**), German prince: b. Augustenborg, island of Als, Denmark, Jan. 22, 1831; d. London, England, Oct. 29, 1917. He was the son of Duke Christian Augustus, who in 1848 placed himself at the head of his adherents to resist by force the claims of Denmark upon the duchies. Father and son narrowly escaped cap-

ture by the Danes at the time. The duke hurried to Berlin to beg the intervention of Prussia. Prince Christian, then 17, joined the newly constituted Schleswig-Holstein army with his elder brother, Frederick. They were defeated at the Battle of Idstedt in 1850 and Christian finally had to seek a new home. The death of Frederick VII of Denmark in 1863 reopened the Schleswig-Holstein question. But Bismarck had long kept the annexation of the duchies in mind, a policy he carried out by war in 1864. Christian went to England in 1865 and in the following year he married Princess Helena, third daughter of Queen Victoria. He was created "Royal Highness" by order of Queen Victoria, and with his wife settled down as an English country gentleman.

CHRISTIAN REFORMED CHURCH, The, a church officially established in the United States in the year 1857. Its history, however, begins in the Netherlands in 1834, when the Reverend Hendrick de Cock was deposed from the Reformed State Church of the Netherlands because of his disagreement with official interpretations of the Reformed faith. Many soon followed the lead of de Cock, among them being Dr. Albertus C. van Raalte, who led a band of pioneers to Holland, Michigan, and the Reverend Hendrik Scholte, who established his followers at Pella, Iowa. Religious intolerance in the Netherlands was the main motive for emigration, but the economic situation presented an added incentive. About two years after the arrival in America in 1847, van Raalte's group joined the Reformed Church in America (q.v.), which has existed in the United States and antecedent colonies since 1628; Scholte's group joined in 1856.

The union of the 19th century Dutch pioneers with the Reformed Church in America was an unhappy one. The long established Reformed Church seemed to the zealous newcomers deficient in doctrinal purity, neglectful of catechetical training and church discipline, and they were shocked that the sacrament of communion (the Lord's Supper) should be administered to all indiscriminately. The prevalence of these customs in Holland was the very reason why they had left the Netherlands. Secession from the Reformed Church occurred on April 8, 1857, when four congregations (about 750 families) and one pastor resigned. This small group called themselves the True Dutch Reformed Church, later changing their name to Christian Reformed Church.

Slow growth marked the progress of the infant church until around the year 1880, when two important events changed the picture. The first event was another schism within the Reformed Church of America. Contention had developed over the admittance of lodge members into the church. Many within the church refused to affiliate with lodge members and, as a result, five large and influential churches seceded and joined the Christian Reformed Church. The second event promoting growth was the heavy influx of Dutch Calvinists after 1880. Emigration from Holland accounts for the phenomenal growth amounting to 40,000 people in the years between 1880 and 1900.

The membership in 1953 totaled 173,764; the clergy, 304. They are grouped into 19 classes which meet two or three times each year. The classes

are annually represented by two ministers and two elders (lay officers) in a general synod which has authoritative jurisdiction over all the congregations. A modified presbyterial form of government functions.

As for its doctrinal commitments, the Christian Reformed Church subscribes to the Apostle's Creed, the Nicene Creed and the Athanasian Creed. In addition to these, the church embraces three Calvinistic confessional standards: the Belgic Confession of Faith (the Thirty-Seven Articles of Faith), the Heidelberg Catechism and the Canons of Dort. The Heidelberg Catechism is by far the most widely used confession of the Christian Reformed Church. Each minister must regularly and faithfully preach the "sum of Christian doctrine as comprehended in the Heidelberg Catechism." (It is divided into three sections—our sin and misery, our deliverance through Christ, and our gratitude to God.) In the Canons of Dort we have the clearest expression of the Reformed position as expressed in the five points of Calvinism. The five points of doctrine are as follows: (1) *unconditional election*; i.e., God has chosen His people from eternity, apart from any inherent goodness or work of man; (2) *limited atonement*; i.e., Christ died on the cross not to save all indiscriminately, but only those whom He elected; (3) *total depravity*; i.e., man is conceived and born in sin and is "incapable of doing any good, and neither able nor willing to return to God"; (4) *irresistible grace*; i.e., the power of Christ which seeks to draw His people to Himself is unable to be resisted by the will of man; (5) *the perseverance of the saints*; i.e., God, by His Spirit, preserves the new life given to the sinner, and brings it safely through life to its abode in heaven.

From such doctrinal commitments, it can be seen that the Christian Reformed Church is rooted firmly in the Calvinistic-Augustinian tradition, which in turn is based on the divinely inspired Word of God.

EARL JABAAY.

CHRISTIAN SCIENCE, a religion based wholly upon the spiritual meaning of the Bible and primarily upon the words and works of Christ Jesus. It was discovered and founded by Mary Baker Eddy in 1866, following her immediate recovery from a serious accident. On the third day after the accident, she turned to her Bible for help and was instantaneously healed of the injury.

Healing, not only of sickness and sin, but of all forms of discord is regarded by those who practice this Science as among the inevitable effects of its correct application. This religion gives its adherents a new outlook on life and it is accepted by them as a completely regenerating and reforming influence in the degree that it is truly practiced. The growth of the denomination is conceded to be largely the result of healing.

Christian Science differs mainly from other religious denominations by utilizing spiritual power through prayer for the solution of prob-

lems of every nature. The application of Christian Science to health is quite generally known. Christian Scientists also hold that there are no situations for which this religion does not provide the remedy.

Christian Science teaches that God, who according to the Gospel of John is Love, is also infinite Life, Principle, Spirit, and that He is eternal good. It also teaches that because, according to the first chapter of the Book of Genesis, man is made in the image and likeness of God, man must be spiritual and not material, nor is he subject to material conditions.

The textbook of the denomination, *Science and Health with Key to the Scriptures*, was published by Mrs. Eddy in 1875. It is used in conjunction with the Bible at Sunday services in all Christian Science churches. Selections from these two books comprise the "Lesson-Sermons" read by a First and a Second Reader. There are no personal pastors in the Christian Science church. The Lesson-Sermons cover twenty-six subjects and are uniform in all churches.

The Church of Christ, Scientist, is comprised of The Mother Church, The First Church of Christ, Scientist, in Boston, Mass., and its more than 3,000 branches located throughout the civilized world. It was organized in Boston in 1879, with a membership of twenty-six. It was "designed to commemorate the words and works of our Master, which should reinstate primitive Christianity and its lost element of healing" (*Church Manual*, p. 17).

Mrs. Eddy did not at first intend to found a separate church, but in a short time it became evident that a distinct church was needed to facilitate the establishment and promotion of her religion and maintain its teaching and practice. In *Science and Health* she writes, "Until the author of this book learned the vastness of Christian Science, the fixedness of mortal illusions, and the human hatred of Truth, she cherished sanguine hopes that Christian Science would meet with immediate and universal acceptance" (p. 330).

The progress and growth of the movement while not considered phenomenal, has been steady and today there probably is not a village or town where Christian Science is not known. In accordance with the bylaws of the church, no membership figures are published. The number of its members is not considered important, but those outside the movement estimate the total as several hundred thousand.

The first church edifice was built in Oconto Wisconsin, in 1886, and is still being used for church services. In 1894 the original edifice of The Mother Church was built in Boston. Although it seats approximately 1,000 persons, it was soon found inadequate to take care of the increased attendance, and in 1906 an extension with a seating capacity of nearly 5,000 was built.

Mrs. Eddy attached great importance to periodical literature. In 1883, she founded *The Christian Science Journal*, a monthly publication which contains in addition to articles, editorials, and other literature on Christian Science, a list of branch churches and societies, a list of Christian Science practitioners and of nurses. *The Christian Science Quarterly*, containing the Lesson-Sermons for Sunday services, was established in 1890. *The Christian Science Sentinel*, a weekly, was founded in 1898; the *Herald of Christian Science* in 1903; and *The Christian*

Science Monitor in 1908. The *Herald of Christian Science* is published in seven foreign languages, German, French, Danish, Norwegian, Swedish, Dutch, and Spanish, and also in Braille.

Although most of these periodicals circulate chiefly among those who have some degree of interest in Christian Science, the *Monitor* has become world-wide in its circulation and is well known and read by a great many who are interested in factual news reporting. The *Monitor* maintains its own staff of correspondents and has branch offices in London, Paris, Geneva, and Sydney, as well as twelve branch offices in the United States.

All of the periodicals of the movement are published by The Christian Science Publishing Society, which was established by Mrs. Eddy in 1898. It occupies a block-long edifice in Boston and employs more than 1,000 persons. It is estimated that 80,000,000 pieces of literature are published annually by the Publishing Society.

From its inception, the Christian Science church has taken an interest in world affairs. The members respond generously to appeals for assistance to sufferers when emergencies arise calling for financial aid. During World War I and World War II, the Christian Science organization assisted those countries affected by the war continuously during each conflict, and after. During a period of less than forty years, commencing with 1913, The Mother Church contributed \$15,147,849.98 for relief. This amount does not include the work done individually by branch churches in their immediate vicinities.

There are no missionaries as such in the Christian Science Church. There is a board of lectureship, established by Mrs. Eddy in 1898, which is global in its activities. The members of this board, at the invitation of the branch churches, give lectures in practically every country in the world. These lectures are always free to the public and explain the fundamental teachings of the religion.

GEORGE CHANNING,

Manager, Committees on Publication, The First Church of Christ, Scientist, Boston, Massachusetts.

CHRISTIAN SOCIALISM, a type of socialism (q.v.) which results from the conflict between the existing practices and ideals of modern industrial capitalism and the Christian gospel. The Christian Socialists endeavor, as a rule, to show how the application of the gospel of Christ to economic and social conditions would solve the problems of underproduction, unemployment, poverty, waste, inadequate distribution, and the many injustices of both the old-fashioned laissez-faire economy and the more restricted modern system of free enterprise.

More specifically, the term is used for a group of British writers, lecturers, and clergymen who in the middle of the 19th century advocated the full application of the Christian gospel to social, economic, and political conditions. Chief among them were (John) Frederick Denison Maurice (1805-1872) and Charles Kingsley (1819-1875). Following the failure of Chartism (q.v.) in 1848 after a decade of effort, Kingsley launched a series of tracts and novels (*Yeast*, 1848; *Alton Locke*, 1850), and a journal was founded (*Politics for the People*, 1848). Workingmen's associations were formed, mainly educational in aim, and in 1854 a workingmen's college was estab-

lished. Cooperatives, including a cooperative wholesale society, were encouraged. In all this there is almost no trace of Marxian influence, though Karl Marx (q.v.) lived in London from 1849 to his death in 1883. The Christian Socialists were not inspired by any communistic or socialistic theory, but by fervent evangelical and liberal study of the Bible and by an earnest Christian and humanitarian concern for the poor and the underprivileged. Their influence survived long and beyond the decade following 1848. The Fabian Society (q.v.), organized in 1883, though assured of the steady improvement of social conditions in the modern world as the result of "evolution" and "progress," was likewise strongly opposed to Marxism and materialism. Though its presuppositions were sharply to be distinguished from those of the Christian Socialists (which were clerical and theological), the society nevertheless owed an immense debt to the earlier movement. Christian Socialism has never died out in the Anglican Church.

In North America the movement became prominent in the 1890's, led by such famous clergymen as Washington Gladden (1836-1918) and William Dwight Porter Bliss (1856-1926). Later movements, such as the Christian Social Fellowship, the Church Socialist League, the Church League for Social Democracy (now the Church League for Social Action), the Frontier Fellowship (a student organization), have carried on propaganda for these views. Walter Rauschenbusch (1861-1918) was a leading exponent of the movement; his *Christianity and the Social Crisis* (1907) and *Christianizing the Social Order* (1912) won a respectful hearing for the "social gospel" throughout the nation.

In Europe, Christian Socialism is usually understood in a more political sense, as a substitute for secular socialism—indeed, the movement has taken a place among the political parties of Germany, Austria, France, Italy, and other countries, sometimes under other names (such as the Christian Social Democratic Party). The Roman Catholic Church has contributed greatly to the clear statement of Christian social views. A series of important papal encyclicals (especially *Rerum Novarum*, 1891, on the condition of the workers, and *Quadragesimo Anno*, 1931, on reconstructing the social order) has dealt with the questions of work and wages, employment, family life, and the duty of employers and employees. These encyclicals have done much to encourage Christian social idealism, to discourage materialistic Marxism, and to stabilize political socialism. Despite the extravagances of Hitler's "National Socialism"—indeed quite in opposition to it—Catholic idealists have insisted upon the possibility of a genuinely Christian social order, in which Christian principles both will ameliorate the evils of unrestrained capitalism and will avoid those of materialistic socialism.

FREDERICK C. GRANT.

CHRISTIAN UNION CHURCHES, a small body of Christians, organized in 1861,

partly in protest against the preaching of politics. Rev. James F. Given, who left the Methodist Church in 1860 because the Civil War was advocated from its pulpits, drew together those who were of his way of thinking and they organized the Christian Union, at Columbia, Ohio, in 1864. In 1938 it reported 15,400 members and 220 churches.

CHRISTIAN UNITY. The phrases "Christian Unity," "Church Unity," "Christian Reunion," "Ecumenical Movement" (the last being more common since 1927) are terms used to designate the movement to restore the broken unity of the Christian church. Although efforts have not been lacking in the past, the world-wide effort to achieve such unity (not only in the older centers of Christianity in Europe and America but also upon the foreign mission fields of Asia, Africa, and elsewhere) is a marked feature of modern Christian history, chiefly since 1910. After the breach between East and West (between Rome and Constantinople in 1054) repeated efforts were made to end the schism, chiefly on the side of Rome—as at the Councils of Lyon (1274) and Florence (1439). Similarly in the West since the Reformation the Roman Church and various Protestant groups from time to time have discussed the problem—as in the "Malines Conversations" of 1921–1925. Since the grounds of disagreement are both doctrinal and practical, the principles of both Roman Catholicism and Protestantism have proved too divergent for a simple formula of either submission or compromise to succeed.

Within Protestantism itself there have been many efforts to compose the differences between the various groups or denominations. In fairness to the leading Reformers of the 16th century it ought to be said that (except for Luther) they cherished the idea of church unity and probably never dreamed that the result of the Reform movement would be a continued process of division and subdivision. Various proposals were entertained or offered by official bodies in the 16th and 17th centuries for the settlement of controverted issues and for the establishment of one type of orthodox doctrine and of organization, at least within each single nation (on the principle of *cuius regio, eius religio*: "whose is the territory, his is the religion"—the prince's faith determines that of his subjects). As a result, each nation with an established Protestant state church was confronted with groups of dissenters, who in time either won their liberties or were suppressed or were expelled, with the further consequence of the rise of still more separatist sects.

Since the 17th century, and especially since the end of the 18th, a wholly new outlook has come to characterize Western Christendom. The bitter theological controversies of the early days of Protestantism have been forgotten; an intensely practical emphasis has taken place in Western society as a whole—the immense missionary expansion of the Christian religion since 1800; and the closer contacts with other churches (including the Orthodox Eastern and the Roman Catholic)—these and other factors have brought home to modern Protestants the seriousness of their unhappy divisions and have made it clear that if the church is ever to achieve its world-mission it must be united. The voice of the church on public issues must not remain a con-

fused babel of separate voices; the overlapping and duplication of efforts, especially in the mission field, must stop; competition must yield to cooperation both in the churches at home and in the world at large. At the same time the conviction has deepened among the leaders of the churches that the theoretical objections to disunity are as real as the practical: it is contrary to the very first principles of the Christian religion that the church should be divided; the New Testament insists upon a religion with "one Lord, one faith, one baptism, one God and Father of us all" (Ephraim 4:5); in a multiplicity of churches not all can be the "true" church, though each may hold one or more aspects or qualities of the true church. Hence there has developed in modern Protestantism the conception of a genuinely attainable unity in diversity—to be achieved not through uniformity but through an inner unity of the spirit (Ephraim 4:3), which will command the loyalty of all: "in essentials unity; in nonessentials liberty; in all things charity." In a sense the church has never been wholly united, not since the apostolic age; in another sense the unity of the church has never been broken, for the spiritual unity of Christians in Christ has remained real through all historical vicissitudes. These principles are of major importance in the modern approach to Christian Unity, which aims to include all genuine expressions of Christian faith and practice rather than to exclude all except those which conform to a certain type, though there is no wish to limit unity to the "greatest common denominator" of beliefs.

The modern movement toward reunion began late in the 19th century, The Chicago-Lambeth Quadrilateral of 1886 proposed as a minimum basis of agreement the Holy Scriptures, the Nicene Creed, baptism and the Lord's Supper, and the historic episcopate. This led in 1910 to the Protestant Episcopal Church's proposal of a world conference on matters of faith and order; the ensuing ecumenical conferences (from that at Edinburgh in 1910 to that at Amsterdam in 1948, when the World Council of Churches was organized) mark the successive steps toward the goal. At the latter conference the Orthodox East was represented but not the Roman Catholics, except by unofficial observers. The leading spirit in the earlier negotiations was Bishop Charles Henry Brent (q.v.). After Brent's death in 1929, William Temple, archbishop of Canterbury, assumed the leadership, and, although he died in 1944, his spirit and thought were enormously influential in preparing men's minds for the action taken at Amsterdam four years later.

Seminary.

CHRISTIAN YEAR, The. *The Christian Year*, by the Rev. John Keble, is a series of metrical compositions or thoughts in verse for the Sundays and holy days throughout the year. The work was intended to be an aid to the reader of the Book of Common Prayer of the Established Church of England; its object, in the words of the author, "will be attained if any person find assistance from it in bringing his own thoughts and feelings into more entire unison with those recommended and exemplified in the Prayer Book." It has, also, an historical significance, inasmuch as it expresses in poetry the spirit which inspired the Oxford Movement (q.v.). Although it does not contain the best of Keble's poetry, it is the work by which he is most widely known, and by which, in all likelihood, he will be chiefly remembered. When published in 1827, its success was immediate. It was, and doubtless remains, one of the most successful series of religious poems ever published, and before the end of 1867, the work had run into 109 editions—the editions in each case varying from 3,000 to 600 copies.

It is not difficult to account for the success of *The Christian Year*. The different poems expand, elaborate, and illuminate some of the most familiar and most cherished Scriptural scenes, events, and texts. It is doubtless true that most people are not "athletic readers"; that most do not think strenuously, or use their imagination effectively, while they are reading. A substitute, or aid, such as Keble supplies, usually does not fail to attract attention and gain wide acceptance. There is, also, in *The Christian Year* certainly enough of true poetic quality to sustain the whole.

CHRISTIANA, the wife of Christian in John Bunyan's *Pilgrim's Progress* (q.v.). She makes her appearance in the second part of the allegory. Moved by a vision, Christiana sets out with her children on the same pilgrimage as her husband, fleeing from the City of Destruction. Her neighbor Mercy accompanies the family, despite the objections of Mrs. Timorous and others. They are escorted by Mr. Greatheart, who overcomes Giant Despair and other monsters, eventually bringing them safely to the Celestial City.

CHRISTIANA, kris-ti-ā'n-ā, town, Delaware, in New Castle County, on Christina Creek, an affluent of Christina River, 4 miles west of New Castle. The village was named in honor of Queen Christina of Sweden (r. 1632-1654), the daughter of Gustavus Adolphus. Like the stream flowing through it, the village was originally called Christina, but in colonial times the name for both became corrupted to Christiana. By an act of the legislature in 1936, the older spelling was restored for the creek but not for the village; however, locally the village name has always been pronounced Christeen. As early as 1686 a bridge spanned the Christina at this point. Many famous travelers stopped at Christiana Bridge. In 1765, Charles Mason and Jeremiah Dixon met here to discuss boundaries with the commissioners of Pennsylvania and Maryland. Colonial shipping often ascended from the Delaware River to load produce, grain, and high-grade flour milled on the banks of the Christina and neighboring streams. Christiana in the mid-18th century with its 70 or 80 houses and two inns, the Christina and the Shannon, had a com-

mercial importance which disappeared a century later with changes in transportation routes. Among the several old colonial structures the most notable is the privately owned Lewden House, built in 1770 and enlarged in 1815. Pop. (1950) 500.

CHRISTIANA, kris-tyā'n-ā, kris-chē-ā'n-ā, town, Jamaica, British West Indies, is situated in the west-central part of the island nine miles north of Mandeville, at an altitude of approximately 2,500 feet. It is the center of an agricultural region in which bananas, ginger, coffee, and pimentos are raised. Pop. (1943) 2,825.

CHRISTIANA, kris-ti-ā'n-ā, town, Union of South Africa, is located on the Vaal River in the southwestern part of the Transvaal, 65 miles north-northeast of Kimberley. The town, at an altitude of 3,968 feet, is the seat of a magistracy. Since 1870 it has been an important center for alluvial diamond diggings. There is excellent fishing in the Vaal at this point, and the surrounding district is noted for its fine flavored grapes and other fruit. A considerable amount of land is under irrigation. White pop. (1950) 2,436; all races, 4,609.

CHRISTIANA RIOT. On Sept. 11, 1851, Edward Gorsuch of Maryland, his son, Dickinson Gorsuch, a party of friends and United States Deputy Marshal Henry H. Kline, having secured a warrant from Philadelphia, came to Christiana, Lancaster County, Pa., to arrest a fugitive slave who formerly belonged to Gorsuch and who had fled northward by means of the underground railroad. They approached the house where the fugitive had taken refuge, fired two shots, and demanded the possession of the slave. The neighborhood was aroused, and several armed Negroes appeared on the scene, as also did Casper Hanway and Elijah Lewis, Quakers, who tried to persuade both parties to disperse. The deputy marshal ordered them to join his posse, but they urged him to withdraw for his own sake. In the exchange of rifle fire which followed, Gorsuch was killed, his son seriously wounded, and the rest fled without capturing the slave. On Nov. 24, 1851, 38 Negroes and Quakers were tried for treason by John W. Ashmead, United States district attorney, before Justice Robert Cooper Grier of the United States Supreme Court at Independence Hall in Philadelphia. Among the counsel for the defense were Thaddeus Stevens, Theodore A. Cuyler, and John Meredith Read, who presented the chief argument. Opinion was so strongly for the prisoners that the jury acquitted them without leaving the box.

CHRISTIANCY, Isaac Peckham, American editor, jurist, and public official: b. Johnstown, N. Y., Mar. 12, 1812; d. Lansing, Mich., Sept. 8, 1890. Descendant of Dutch forebears named Christiaan who emigrated from Leiden to New Netherland in 1614, Isaac passed his childhood on his father's farm near Johnstown, Fulton County, N. Y. Though he had very little formal education he began teaching school at the age of 18. In 1834 he began studying law at Ovid, N. Y., and two years later moved to Monroe, Mich., where he became clerk in the United States land office. Admitted to the bar in 1838, he served three terms as prosecuting attorney of Monroe County (1841-1846). Al-

though a staunch Democrat, the slavery issue impelled him to change his allegiance; he joined the Free-Soil Party and attended its convention at Buffalo in 1848. A member of the Michigan Senate from 1850 to 1852, in the latter year he ran for governor but was overwhelmingly defeated. When the Free-Soil and Whig parties merged in 1854 to form the Republican Party, Christianity became a Republican. He summoned the new party's convention at Jackson, Mich., in 1854 and was a delegate to the first national convention at Philadelphia in 1856. In the latter year, having acquired the *Monroe Commercial*, as its editor he vigorously supported the Republican cause. In 1858, he became one of the first four justices of Michigan's supreme court. Regularly re-elected, he resigned the justiceship in 1874 to go to Washington as senator. Resigning his senatorial seat in 1879, he was appointed minister to Peru by President Hayes. He returned to the United States in 1881 and retired to private life.

CHRISTIANITY. Christianity is the most widespread and the most influential of the religions of mankind. It has as its central and determinative figure Jesus Christ. In these two facts are some of the most provocative questions in human history.

The Unpromising Beginning.—At first sight, Jesus, to whom the designation Christ, or (the Lord's) Anointed, is usually affixed, with the inference that he was the Messiah expected by the Jews, seems most unpromising for the role which has been his. He was of humble birth and was reared in an obscure village. His public career was brief. It appears at most to have been only three years and it may have been much less. He wrote no book nor does he seem to have given much thought toward putting his teaching into organized form. So far as our records show, he appears to have given little attention to creating a continuing organization. He had an exalted conception of his mission and believed that in him God was beginning a new and supremely important stage in man's course, but it is at least doubtful whether he thought of himself as founding a new religion. His intimate friends were drawn largely from what we would call the lower middle class. At a crucial moment one of them betrayed him; another, their chief spokesman, denied him; and the others were bewildered and disheartened. The leaders of his own people accused him of blasphemy and on the charge that he intended to lead a revolt turned him over to a Roman procurator who, somewhat contemptuously, had him crucified between two malefactors. His disciples, profoundly convinced that God had raised him from the dead, formed the nucleus of the Christian church.

Initial Convictions.—The convictions which gripped the first Christians were sweeping and compelling. The term Christianity, in its Greek or Aramaic equivalent, does not appear in the earliest records. The characteristic word, especially on the lips of Jesus, we translate as Gospel. "Good News." As the first Christians saw it, the Good News is that in Jesus, God was inaugurating a new era, His kingdom or rule, in a fresh way. To enter or even to see that kingdom involved such a basic reorientation that it could best be described as a complete change of outlook and purpose, a new birth, becoming once more a little child. The new birth is made possible by God through His Holy Spirit. It is an

introduction to an endless life marked by a whole-hearted response in faith to God, to God who is self-giving love and who through His grace—grace which springs from His Love and which men because of their sin against Him do not deserve—sent His only Son who became flesh in Jesus in order that all who believe in him might be "sons of God, joint-heirs with Jesus Christ" and "should not perish but have everlasting life." That life has as its essential characteristics the knowledge and love of God and "the fruits of the Spirit," that is, "love, joy, peace, long-suffering, gentleness, goodness, faith, meekness, self-control."

Those who have entered upon this life, as the early Christians conceived it, constitute a new community, the church, of which Christ is the head, and which is to be without distinction of sex and is to be drawn from all nations, races, and cultures. The early Christians felt themselves under the compulsion of a commission from Jesus to bring into discipleship all nations, baptizing them, and teaching them to observe all that he had commanded of his first disciples.

Christianity Wins the Roman Empire and Spreads Beyond It.—Yet at the outset Christians appeared to be only one of several Jewish sects, a small minority, with internal divisions, some of them bitter, and without the slightest prospect of great growth or long continuing existence. Moreover, the high demands that Jesus made on those who would follow him seemed to preclude an extensive constituency.

Within five centuries, however, and in spite of the earlier hostility of the state and of much of the populace which broke out in chronic and at times unusually virulent persecution, Christianity won its way, was officially espoused by that state, the Roman Empire, and became the professed faith of the largest group of civilized mankind, the Graeco-Roman world. In doing so it displaced a host of rivals, some of them apparently well-established. In the course of the succeeding 14½ centuries, Christianity was propagated through migrations and missionaries until it had followers among all but a few tribes and peoples. The most widely used chronology dates history B.C. or A.D., before Christ and in the year of the Lord, thus declaring the advent of Christ to be the most significant event in the course of mankind on the planet.

To examine the significance of this record would lead us far beyond the limits of this article and would take us into issues which have long engaged some of the ablest minds and noblest spirits of the human race. Such basic questions are involved as the nature of the universe and of man, the relation of the one to the other, and possible patterns and meaning in history. Here we can only sketch in the most summary fashion the major movements in Christianity which have given it the features that have characterized it across the years and in its 20th century.

It was during its spread through the Roman Empire that Christianity developed the main outlines of the theology, the sacred body of writings, the organizational structure, and the forms of worship and discipline which have been perpetuated in the churches to which the majority of those who bear the Christian name have since belonged.

Early Christian Theology.—From the very beginning the creative impulse which Christianity has shown stimulated first-class minds to wrestle in an original fashion with the intellectual prob-

isms which it presents. Among those who early stood out were Paul of Tarsus (Saint Paul), Tertullian of Carthage, Origen of Alexandria, and Augustine of Hippo (Saint Augustine).

A major contribution of Paul was his successful assertion that to become a Christian it was not necessary to be incorporated into Judaism and that to make Christianity a Jewish sect was to miss the essence of the Gospel. Paul and others like him soon constituted the majority, and those Christians who attempted to keep within the confines of Judaism became a dwindling minority.

The problems which chiefly engaged leading Christian thinkers were God, the nature and nature of man, and the relation of God and man. Christians believed God to be one, but they were concerned to discern how He could be one and to make room in their conception of Him for what were to them facts of experience and history. The favorite name by which Jesus addressed God was Father. This name also was found in Judaism, from which Christianity sprang. Christians felt themselves constrained to regard Jesus as, in a unique way, the Son of God. They knew in themselves a dynamic quality which they called the Spirit, or the Holy Spirit. Very early, therefore, they were thinking of God as one and also as the Trinity, namely, Father, Son, and Holy Spirit. How could this be, what are the characteristics of each of these three, and how are the three related to one another?

The debates on these questions were prolonged and often marked by reciprocal denunciations. In the 2d century they centered about the Gnostics (see Gnosticism) and the Marcionites (see Marcion). Both Gnostics and Marcionites regarded matter, including flesh, as evil, and pure spirit as good, and believed salvation to be the emancipation of human souls from the contamination of matter and their translation into the realm of spirit. They tended to deny that Christ had come in the flesh.

It was in part to meet this threat that what became the majority, and which called itself the Catholic Church, developed tests in order to preserve the faith which Christ had given to his intimates and which these intimates, the apostles, namely those sent out under his commission, had taught. These tests were (1) what is usually called the Apostles' Creed, an elaboration of an early baptismal formula; (2) the New Testament, made up of books attributed either to the apostles or to those instructed by them; and (3) bishops in an unbroken succession from those believed to have been appointed by the apostles.

The major debate in the 4th century was over the issue of whether the Son had been created by the Father rather than "begotten" by Him, and whether he was of "similar" but not of "the same substance" with the Father. Those who held that the Son had been created, that there was a time when he was not, and that he was of "similar substance" were known as Arians. Their views were ultimately rejected by the Catholic Church. (See Arianism.)

A major stage in that rejection was what is known as the First Ecumenical Council, which convened at Nicaea, in Asia, not far from Constantinople, in 325, at the invitation of Constantine, the first Roman emperor to align himself with the church. Constituting a precedent for gatherings designed to act for the entire church, the Council of Nicaea expressed its mind in a

brief document which, with later modifications, is known as the Nicene Creed and continues in use in the churches—Orthodox, Roman Catholic, and Protestant—in which are included the majority of those who bear the Christian name. Churches holding Arian views continued for several centuries but eventually died out. (See also Nicaea, or Nice, The Councils of.)

In further debates over the relation of the divine and human in Jesus Christ, the decision to which the churches that contain most Christians still adhere, was reached in 451, at the Fourth Ecumenical Council, which met at Chalcedon at the call of Marcianus, the Eastern Roman emperor. It held that "our Lord Jesus Christ (is) at once complete in Godhead and complete in manhood, truly God and truly man." Those who differed, stressing the deity of Christ and minimizing his humanity, were known as Monophysites (q.v.). In one or another form their views are still cherished by the Armenian Church, the Jacobite Christians (with headquarters in Syria), the Copts (the majority church in Egypt), and the Abyssinian (or Ethiopian) Church (q.v.).

The nature of man and the manner in which the saving grace of God operates on it were also debated. Especially notable were the convictions of Augustine (354–430), in his later years Bishop of Hippo in North Africa. His own remarkable spiritual pilgrimage and conversion, narrated in his *Confessions*, helped to confirm him in the belief that men at their birth are tainted with original sin which is a legacy from the willful transgression of the first man, Adam. That taint is such that men of their own will cannot obey God's commands or accept His grace in Christ. God, so Augustine said, has predestined or elected those who will accept His grace and thus enter upon eternal life. For those so chosen, Augustine went on to declare, God's grace is irresistible, and, once saved through that grace, they will persevere and enter into eternal blessedness with Him. In contrast, Pelagius (360?–420), a British monk resident in Rome, rejected original sin and insisted that men have free will and can conform to God's commands. For some years the controversy raged, but a century after the death of Augustine the Western portion of the Catholic Church formally adopted his position, although in a modified form. In this, and in other aspects of theology, Augustine profoundly and permanently influenced the Christianity of the West, both Catholic and Protestant.

The Organization of the Church.—Arising as it did within the Roman Empire, the church in part reflected the organizational pattern of that realm. Early there arose a distinction between clergy and laity. The main ranks in the clerical hierarchy were deacons, priests (presbyters or elders), and bishops. The ordination of deacons and priests was by a bishop. To be valid, so it was held, it had to be by a bishop who was in unbroken succession from the original apostles. After a marked variety at the beginning, the practice soon developed of having only one bishop in a town or city. The area over which the bishop had jurisdiction was eventually known as his diocese, a term found in Roman civil administration. Bishops in the larger cities naturally tended to overshadow those in the smaller ones. Those in the major ones, Jerusalem (because it was where the church was born), Rome, Antioch, Alexandria, and Constantinople, came to be

known as patriarchs. The Bishop of Rome, to whom the title of pope was later exclusively given, claimed priority and authority over the entire church. The position of Rome as the capital of the empire and the belief that Peter and Paul had been martyred there aided this claim, but the popes rested their authority primarily on the conviction that Peter was the first bishop of Rome, that upon him Christ had founded the church, that to him Christ had given the keys of the kingdom of heaven, and that they, as the successors of Peter, had inherited his powers.

The political unity of the Roman Empire facilitated the realization of the dream of the oneness of the church which was inherent in Christianity, but, as we have suggested, even a visible, structural unity was never fully achieved, and within the Catholic Church itself there were never lacking failures to achieve the unity of love which is of the essence of the Christian faith.

Sacraments and Worship.—The church early developed what were called sacraments. The original ones were baptism and the Eucharist. Admission to the church was through baptism. For converts it was preceded by a catechumenate, a period of instruction. It was taught that baptism washed away the taint of original sin. The Eucharist, or the Lord's Supper, believed to have been instituted by Christ on the night before his crucifixion, was central in Christian worship. Christ was held to be present in it in a special way. Around it elaborate liturgies developed. To be valid it had to be administered by either a priest or a bishop.

There were additional forms of worship on every day of the week. The first day, Sunday, the Lord's Day, made memorable by the Resurrection of Christ, was observed by rest and worship. There were special days, notably Easter, commemorating the Resurrection. The season which immediately preceded it came to be known as Lent. The observance of the birth of Christ and of other events connected with his life and with that of the church were gradually brought into the calendar. Martyrs and those deemed ideal Christians were revered as saints and their intercession with God was asked. The Virgin Mary was especially honored as "the Mother of God."

Discipline.—One of the features of the life of the church was the effort to bring and hold its members to the high standards set by Christ. It was long held that there was no forgiveness for grave sins committed after baptism, among them murder, adultery, and apostasy. As time passed and the numbers of Christians increased, the Catholic Church made provision for the forgiveness of sins, even of the most grievous. But this was to be only after confession—in the early centuries a public confession before the entire congregation—and after a period of discipline and penance during which the offender was not admitted to the Eucharist. Some groups, among them the Novatians (see *NOVATIANISM*) and the Donatists (q.v.) left the Catholic Church in protest against what they deemed laxity in the treatment of sinners.

Monasticism.—As the numbers of Christians mounted and the general level of morality in the church fell, monasticism (q.v.) arose, in part as a protest and in part as an effort to attain fully to the demands of Christ. Monasticism first became widespread in Egypt in the early part of the 4th century, but it quickly spread or sprang

up independently in other areas. Some monks dwelt alone, as anchorites, and others lived in communities under a common rule and organization. The monastic way of life was adopted by both men and women, but by more of the former than the latter. It entailed poverty, asceticism, and an exacting routine of worship. Various rules were formulated for monastic communities. Famous among the early monastic communities were those of the notable theologian and bishop, Basil of Caesarea in Cappadocia, in the 4th century, and Benedict of Nursia, at Monte Cassino in Italy, in the first half of the 6th century. Both rules spread widely, the former chiefly in the East and the latter in the West.

By the end of the 5th century the overwhelming majority of the population of the Roman Empire bore the Christian name. While Christianity had spread beyond the borders of that realm, notably eastward into Mesopotamia and the Persian Empire and to India, it had become almost identified with the Roman Empire and Graeco-Roman civilization.

The Great Recession, c.500 A.D.—c.950 A.D.—With the decline of the Roman Empire came a series of blows which threatened the very existence of Christianity. The decline of Rome is usually dated as beginning late in the 4th and early in the 5th centuries. It arose partly from internal weakness, weakness of which Christianity was neither the cause nor the cure. It was signalized and to a large degree brought about by invasions, some by barbarians from the north and some by Arabs from the southeast. The latter were champions of a new religion, Islam, which came to birth through Mohammed in the 7th century. The northern invaders were either pagans or Arian Christians, but in time most of them were won to the Catholic faith. The Moslem Arabs overran about half of what had been embraced in the Roman Empire and with it approximately half of what might be called Christendom. In the Arab-ruled lands the churches dwindled and in some areas on the north shore of Africa completely disappeared. Only in Sicily and what are now Spain and Portugal did Christianity ever regain the territory won by Islam.

Moreover, as the Roman Empire waned, the Catholic Church, deprived of the support given by its embracing structure, drifted apart into regional fragments. The two chief of these centered around Rome in the West and Constantinople in the East, the nuclei respectively of the Roman Catholic Church and the Orthodox churches. While in the 7th century Christianity had spread as far eastward as the China Sea, by the middle of the 10th century it had lost so much ground and had suffered so greatly in inner morale that it was not at all clear whether it would survive.

A Forward Surge, c.950 A.D.—c.1350 A.D.—From about the middle of the 10th century to about the middle of the 14th century, Christianity had a forward surge which carried it over a wider area than at any earlier time, and it left a deeper impress upon segments of mankind, mainly in western Europe, than it had in the heyday of its influence in the Roman Empire. Between the 9th century and the 14th century Christianity won the professed allegiance of most of such peoples in Europe as had not earlier adhered to it. These peoples included Scandinavians, the Poles, the Czechs, the Magyars, the Bulgars, and many of the Russians. Scandinavians carried the faith to

Greenland and possibly to North America. Christian minorities arose across Asia, chiefly through the Nestorians (see NESTORIANISM) who were the major church in Mesopotamia, Persia, and India, and through Roman Catholics from western Europe. In western Europe many new monastic orders sprang up, evidence of earnest commitment to the Christian faith. Prominent among them were the Cluniacs, the Cistercians, the Franciscans, and the Dominicans (qq.v.). Western Europe also was the scene of marked theological ferment. Among the outstanding theologians were Saint Anselm, Peter Abelard, and, towering over them all, Saint Thomas Aquinas. The papacy increased in power and was potent in most aspects of the life of Europe. The vitality inherent in Christianity also found expression in movements which the Catholic Church denounced as heretical. Prominent among them were the Cathari and Waldenses (q.v.) in the West and the Bogomils and Paulicians (qq.v.) in the East. Every phase of the culture of western Europe was in part molded by Christianity. This was true in religion, politics, education, literature, scholarship, business ideals, ethical standards, and social customs and institutions.

A Second Recession, c.1350 A.D.-c.1500 A.D.—From approximately the middle of the 14th century to the beginning of the 16th century there was another recession in the Christian tide. However, it was neither so prolonged nor so severe as that which followed the 5th century. Through the dying out of the Scandinavian settlers, Christianity disappeared from Greenland. The minorities which represented Christianity in central and eastern Asia also vanished. The conquests of the Ottoman Turks brought a fresh advance of Islam which made it dominant in Asia Minor, Constantinople, and much of the eastern Mediterranean region. In western Europe, the chief remaining stronghold of Christianity, the Renaissance, a prolonged division between rival lines of popes, and widespread corruption among the clergy both high and low brought a decline in the morale of the church.

Yet there was much evidence of vitality, partly in new monastic movements and in a rise in the devotional life which gave birth to such classics as *The Imitation of Christ* and *The German Theology*, and partly in movements, notably the Lollards (q.v.), begun by John Wycliffe in England, and the followers of John Huss (or Hus) in Bohemia, which were regarded as heretical by the Catholic Church. In the Russian Orthodox Church there was vigorous life which showed itself especially in monasticism. One trend in Russian monasticism, that of the nonpossessors, was toward complete poverty together with retreat from all self-assertion.

Renewal and Advance, c.1500 A.D.-c.1750 A.D.—Beginning late in the 15th century and mounting in the 16th and 17th centuries, there came the greatest awakenings which Christianity had thus far experienced. These had several expressions. One was the Protestant Reformation, which began in 1517 at Wittenberg in Germany under the leadership of Martin Luther, Augustinian monk and university professor. Its distinctive tenets were salvation by faith and the priesthood of all believers.

Protestantism took four major forms: (1) Lutheranism became the prevailing religion in northern Germany and Scandinavia with smaller

groups in the Netherlands, Hungary, and Transylvania. (2) The Reformed and Presbyterian churches had as their chief figure John Calvin, whose *Institutes of the Christian Religion* (1536) became a standard statement of Protestant theology. The Reformed churches were prominent in Switzerland, France, southern Germany, the Netherlands, and Scotland, and were also found in some other countries. (3) The Church of England broke with Rome. It preserved many of the features inherited from its Catholic past and was also influenced by Protestantism. (4) The Anabaptists, on the extreme fringe of Protestantism, and mostly persecuted minorities, displayed great variety.

Reform swept across the Roman Catholic Church, renewed its zeal, and purified its morals. Beginning in Spain before Luther, it soon became in part a reaction against Protestantism. Out of the Counter Reformation arose new monastic orders, the stiffening of the discipline in old orders, and the Society of Jesus, founded by Saint Ignatius of Loyola. The Council of Trent, meeting intermittently from 1545 to 1563, enacted legislation which furthered reform in the Roman Catholic Church and also defined the beliefs of that church as against Protestants. Conflicts between Protestants and Roman Catholics contributed to a number of wars, notably the Thirty Years' War, 1618-1648, fought mainly in Germany. (See COUNTER REFORMATION; JESUITS; TRENT, COUNCIL OF.)

In the 17th century Russia saw secessions from the official Orthodox Church, the Old Believers, partly a protest of the humbler classes against what they deemed heretical innovations forced on them by the bishops.

Beginning late in the 15th century, Christianity had the greatest geographic expansion which it or any other religion had thus far displayed. It was largely, although not entirely, connected with the explorations, conquests, and migrations of Europeans, chiefly those of the Spaniards and Portuguese, but also those of the French, the Dutch, and the English. By this expansion Christianity was planted through much of the Western Hemisphere, along the coastal fringes of Africa, and in some of the islands which bordered southern and eastern Asia, and was strengthened in India and reintroduced into China. The expansion was mostly by Roman Catholics, but across the northern reaches of Asia it was by the Russian Orthodox, and in the English and Dutch possessions, notably in the 13 colonies which were soon to become the United States, it was by Protestants.

Pause, c.1750 A.D.-1815 A.D.—In the latter part of the 18th century there came a pause in the Christian tide. The rationalism and skepticism of the Enlightenment, the French Revolution and wars which engulfed Christendom, and the papal suspension of the Society of Jesus threatened a major recession. Before it gained headway, however, there was another forward pulsation.

The Great Century, 1815-1914.—The century between the end of the Napoleonic Wars in 1815 and the outbreak of World War I in 1914 was marked by quite contradictory currents. On the one hand, several forces worked against Christianity and seemed to presage its demise. Among them were a continuation of the 18th century rationalism, fresh scientific discoveries, the Darwinian theory of evolution, new ideologies

including especially communism, a trend toward secularism, and strong anticlerical movements in Roman Catholic lands. On the other hand there was a fresh burst of life in Christianity. This was seen in the Orthodox churches, especially that of Russia, still more in the Roman Catholic Church, and most impressively in Protestantism. The revivals in Protestantism were particularly marked in the two lands which had the greatest growth in wealth and power in the 19th century, Great Britain and the United States.

The surge of vitality found expression in a number of ways. Among them were new congregations and monastic orders in the Roman Catholic Church, the erection of thousands of church structures, the expansion of the Sunday school movement which had begun late in the 18th century, the rise of the Young Men's Christian Association and the Young Women's Christian Association (qq.v.), additional Protestant denominations, the remarkable growth of several existing Protestant denominations, and the further geographical expansion of the faith. That expansion was brought about partly by migrations of Christians to new areas, mainly in the United States, Canada, Australia, New Zealand, South America, and South Africa, and partly by missions among non-European peoples. For the first time Christianity had become worldwide.

The Latest Age.—The period to which World War I was an introduction brought added threats to Christianity. By some observers it was declared to have ushered in the post-Christian era. Over and beyond the continuation of the adverse forces of the 19th century, world wars ravaged the traditional Christendom and revolutions swept across it, some of them, engineered by fascism and national socialism, in effect anti-Christian, and the major one, that which put communism in the saddle, frankly so.

In Europe, the heart of Christendom, the numbers of practicing Christians declined. Yet, by a seeming paradox more pronounced than that of the 19th century, Christianity registered striking gains. These were partly in the mounting proportion of church members in the population of the United States and partly in increases in the Christian minorities in most non-Occidental lands, notably Africa south of the equator, India, Indonesia, until 1940 in Indochina, until 1950 in China, and, with a pause in the late 1930's and the early 1940's, in Japan. The gains were also seen in vigorous theological currents in the Roman Catholic Church and especially in Protestantism, in the deeper rootage of Christianity among non-Western peoples in trained and devoted leadership, in the fashion in which Protestants were moving to a growing unity among themselves which also drew in some non-Protestants, and in wide-reaching and multiform effects on mankind.

Sterling Professor of Missions and Oriental History, Emeritus, in Yale University.

CHRISTIANSAND. See KRISTIANSAND.

CHRISTIANSBURG, krís'chänz-bürg, town, Virginia, seat of Montgomery County, is located in southwestern Virginia 27 miles west-southwest of Roanoke at an altitude of 2,005 feet. It is in the center of an agricultural and bituminous coal area, and canned goods, furniture, lumber, and clothing are the principal manufactured products. There are also stockyards in the town, which is served by the Norfolk and Western Railroad. Christiansburg was founded in 1792 and incorporated in 1916. Pop. (1950) 2,967.

CHRISTIANSHAAB, krës'tyáns-hóp, settlement, Greenland, seat of a district with the same name, is situated on Disko Bay on the western coast of Greenland 40 miles east-northeast of Egedesminde. It is a fishing and hunting base and there is seal-oil refining. The settlement, which was founded in 1734, has a population (1945) of 181, and the district has a population (1945) of 648.

CHRISTIANSTED, krís'chän-stëd; Dan. krës'tyán-stëth, town, capital of Saint Croix Island, Virgin Islands of the United States, is located on the northern coast of St. Croix, 45 miles south-southeast of Charlotte Amalie on St. Thomas Island. Lying on a picturesque coral-bound bay, the city was formerly the capital of the Danish West Indies. Sugar and semi-tropical fruits and vegetables are grown in the surrounding region. The town is called Bassin by the older natives. Pop. (1950) 4,112.

CHRISTIANSUND. See KRISTIANSUND.

CHRISTIE, krís'ti, Agatha Mary Clariessa (nee MILLER), English detective-story writer: b. Torquay, Devonshire, England, 189? Privately educated, she later studied music in Paris, and in 1914 was married to Col. Archibald Christie from whom she was divorced in 1928. In 1930 she

married Max Mallowan, an archaeologist, whom she has accompanied on several archaeological expeditions to Syria and Iraq. Beginning with her first detective story, *The Mysterious Affair at Styles* (1920), the novels of Agatha Christie have achieved an international popularity, and in the neat little Belgian detective, Hercule Poirot, with his intuitive methods and his great confidence in his own "little grey cells," she created a celebrated literary character in the tradition of Sherlock Holmes. Her best-known detective story is *The Murder of Roger Ackroyd* (1926).

Other detective stories by Agatha Christie include *Peril at End House* (1932); *Murder in the Calais Coach* (1934); *Dead Man's Mirror* (1937); *And Then There Were None* (1940); *The Crooked House* (1949); *A Murder is Announced* (1950); *They Came to Baghdad* (1951).

CHRISTIE, Annie Rothwell (nee FOWLER), Canadian poet and novelist: b. London, England, Mar. 31, 1837; d. New Liskeard, Ontario, Canada, July 2, 1927. She migrated to Canada in early life and settled on Amherst Island near Kingston, Ontario, later moving to Ottawa. The contributor of short stories to Canadian, American, and English periodicals, she also wrote for the *Magazine of Poetry* and received high praise from Sir Edwin Arnold for her verses dealing with Riel's Rebellion. Her novels include *Alice Gray* (1873), *Edged Tools* (1880), *Requital* (1886), and *Loved I Not Honour More* (1887).

CHRISTIE, James, English auctioneer and founder of a line of London auctioneers: b. 1730; d. London, Nov. 8, 1803. He resigned a naval commission to become an auctioneer, his first sale taking place in 1766. Two years later he moved to premises in Pall Mall, and his rooms were shortly used as exhibition galleries by the Royal academicians. Within a few years his auction rooms had become the chief center in Europe for the distribution of works of art and an important rendezvous for fashionable society. He was an intimate friend of Thomas Gainsborough, who painted his portrait, Sir Joshua Reynolds, and David Garrick.

His son, JAMES CHRISTIE (b. London, 1773; there, Feb. 2, 1831), entered the elder Christie's business, carrying it on with increased success after the father's death. A critic of fine arts, the younger Christie did considerable antiquarian research on Greek and Etruscan vases and sculpture. His own sons, JAMES STIRLING CHRISTIE (d. 1834) and GEORGE HENRY CHRISTIE (d. 1887), carried on the firm after his death. In 1859, with later partners, the firm acquired the present name of Christie, Munson, and Woods; however, the Christie family's connection with the business ceased in 1889 upon the retirement of JAMES H. B. CHRISTIE, the son of George Henry Christie. For most of its nearly two centuries of existence Christie's has been one of the most important art centers of the world and as such has seemed to many more like a British national institution than a commercial firm.

SAMUEL HUNTER CHRISTIE (b. London, Mar. 22, 1784; d. Twickenham, Middlesex, Jan. 24, 1865), another son of James Christie, the elder, achieved fame as a mathematician. As assistant in and later professor (1838-1854) of mathematics at the Royal Military Academy at Woolwich, he helped transform the examination system of the academy. He made numerous experiments in the fields of magnetism and the conductivity of metals,

and was elected a fellow of the Royal Society in 1826.

The eldest son of S. H. Christie, Sir WILLIAM HENRY MAHONEY CHRISTIE (b. Woolwich, London, Oct. 1, 1845; d. at sea, Jan. 22, 1922), was noted as an astronomer. Following his education at King's College, London, and Trinity College, Cambridge, Christie in 1870 was appointed chief assistant at the Royal Observatory, Greenwich. He succeeded Sir George Biddell Airy as the astronomer royal in 1881, and during his term of office, which ended in 1910, activities at the Greenwich Observatory were expanded considerably. At this time a 30-inch reflector and a 26-inch photographic refractor were erected, new buildings were added, and photographic and spectroscopic observation techniques were developed. Christie designed an altazimuth and made several expeditions for observations of solar eclipses. Elected to the Royal Society in 1881, he was also prominent in the activities of the Royal Astronomical Society.

Consult Colson, Percy, *Story of Christie's* (London 1951).

CHRISTIE, Richard Copley, English scholar and bibliophile: b. Lenton, Nottinghamshire, England, July 22, 1830; d. Ribsden, Windlesham, Surrey, Jan. 9, 1901. As a teacher, administrator, and benefactor, Christie served Owens College (q.v.) in Manchester throughout his lifetime. Educated at Lincoln College, Oxford, he began his career as a teacher at the newly founded Owens College where he simultaneously held chairs in history, political economy, and law. He was called to the bar from Lincoln's Inn in 1857 and practiced law from 1857 to 1877. With the reconstitution of Owens College in 1870, Christie became one of the governors, to be a lifetime position, and a member of the college council, a seat he held until 1886. From 1872 to 1894 he also held the position of chancellor of the diocese of Manchester. He donated to Owens College the Christie Library, which was opened in 1898, and bequeathed to it his personal library of 75,000 volumes rich in Renaissance literature. After his professional retirement he devoted much time to scholarly researches, *Étienne Dolet, the Martyr of the Renaissance* (1880) being his first major publication.

CHRISTIE JOHNSTONE, a novel by Charles Reade, published in 1853. The story, by turns humorous and pathetic, abounds in vivid scenes of Scottish life by the sea. Into this tale Reade wove his art criticism favorable to the Pre-Raphaelites and opposed to the Royal Academy.

CHRISTINA, kris-tē'nà, queen of Sweden: b. Stockholm, Sweden, Dec. 8, 1626; d. Rome, Italy, April 19, 1689. The daughter of Gustavus Adolphus and Maria Eleanora of Brandenburg, she was educated in a masculine manner. Upon the death of her father in 1632, the Riksdag appointed five guardians to Queen Christina, the leading spirit in the regency being the powerful Count Axel Oxenstierna. In 1644 in her 18th year Christina took upon herself the government. A great talent for business and great firmness of purpose distinguished the first steps of the young queen. She terminated the war with Denmark and obtained several provinces by the treaty concluded at Brömsebro in 1645. Then, contrary to the advice of Oxenstierna, who hoped to gain still

greater advantages for Sweden by the continuance of the general war, she labored to re-establish peace in Germany in order to be able to devote herself uninterruptedly to the sciences and the arts of peace. Due to the queen's interference, Sweden's gains by the Peace of Westphalia concluding the Thirty Years' War were definitely reduced.

Although probably the most accomplished and learned woman of her time, she was of a restless, capricious, and extravagant nature; nevertheless, she did much to promote commerce, encourage manufactures, and patronize learned and literary institutions. She declined to marry her cousin, Charles Gustavus, prince of the Palatinate, but induced the Riksdag in 1650 to designate him as her successor. From that time Christina neglected her older ministers and listened to the advice of ambitious favorites, and soon the country was divided into two parties, the aristocrats led by Oxenstierna and the party of the people supported by the queen. Dissension, attempts at revolt, and the squandering of the property of the crown characterized this part of her reign. Distinctions were conferred upon the undeserving, producing jealous murmurs, complaints, and factions. In this state of confusion the queen declared her intention of abdicating the crown. She was, however, dissuaded from her resolution, and grasped with firmness once more the reins of government, though continuing to concern herself primarily with art, philosophy, and religion. To her court came many learned men, including René Descartes and Hugo Grotius, with whom she conversed familiarly on literary and philosophical subjects. But with new troubles, Christina, who loved whatever was uncommon, resumed her determination to resign the crown.

In the presence of the Riksdag in 1654 she finally laid aside the insignia of royalty to surrender them into the hands of Prince Charles Gustavus. She reserved to herself, nevertheless, a certain income, entire independence, and full power over her suite and household. She soon left Sweden for Brussels, where she made a secret profession of the Roman Catholic faith, which she afterward publicly confirmed in Innsbruck. From there she went to Rome and was confirmed by Pope Alexander VII. In 1656 she visited France, where her dress and manners produced an unfavorable impression, although her talents and knowledge were generally admired. While at Fontainebleau during a second visit in 1657 she had Giovanni Monaldeschi, her grand equerry, executed as a faithless traitor. Cardinal Mazarin succeeded in accelerating her departure from France under various pretexts.

After the death of Charles X Gustavus in 1660, the queen made a visit to Sweden under the pretense of wishing to arrange her private affairs, but it was soon perceived that she had other motives. Since Charles XI, the crown prince, was very young, she declared that in case of his death she would lay claim to the throne. This project was unfavorably received and she was compelled to sign a formal act of abdication. A second attempt in 1667 to recover the throne also failed. She aspired to the Polish crown, but the Poles took no notice of her wishes. Finally she returned to Rome, where she passed the remainder of her life cultivating the arts and sciences.

of Sweden, tr. from the German by Bernard Balogh (Toronto 1935).

CHRISTINE DE PISAN, krēs-tēn' də pē-sān', French author of Italian descent: b. Venice, Italy, 1364; d. in France, c.1430. She went to France in 1368 with her father who became court physician and astrologer to Charles V. Upon the death of her husband, Étienne de Castel, she began to write in order to support herself and her children, and it is said that she was the first woman since antiquity to gain a livelihood by literature. Her writings in verse and prose, which range widely over the fields of philosophy, travel, politics, history, and science, are in a style at times prolix but with elements of a touching melancholy and eloquence.

CHRISTISON, krīs'tī-s'n, **SIR Robert**, Scottish toxicologist and physician: b. Edinburgh, Scotland, July 18, 1797; d. there, Jan. 23, 1882. He graduated in medicine at Edinburgh University in 1819 and subsequently studied in London and Paris. Appointed to the chair of medical jurisprudence at Edinburgh in 1822, he did much to give a scientific basis to that field and especially to toxicology. As medical adviser to the crown in Scotland, he acted as a medical witness in numerous important legal cases. His instructions for the examination of corpses for legal purposes became the standard guide in this work. He made intensive studies on various poisons, publishing his *Treatise on Poisons* in 1829. From 1832 to 1877 he was professor of medicine and therapeutics at Edinburgh. Widely recognized as an authority on the pathology of the kidneys, Christison also published *Granular Degeneration of the Kidneys* (1839).

CHRISTMAS, the feast commemorating the birth of Jesus, observed by the Christian church annually on December 25. The name is derived from the medieval *Christes Masse*, the Mass of Christ. The celebration was not observed in the first centuries of the Christian church, since the Christian usage in general was to celebrate the death of remarkable persons rather than their birth. The death of the martyr Stephen and the massacre of the innocents at Bethlehem had already long been celebrated, when, perhaps in opposition to the doctrine of the Manichaeans respecting the birth of the Saviour, a feast was established in memory of this event in the 4th century. In the 5th century the Western church ordered the feast to be celebrated on the day of the Mithraic rites of the birth of the sun and at the close of the Saturnalia, as no certain knowledge of the day of Christ's birth existed. Among the German and Celtic tribes the winter solstice was considered an important point of the year and to commemorate the return of the sun they held their chief festival of yule, which, like other pagan celebrations, became adapted to Christmas.

Most of the customs now associated with Christmas were not originally Christmas customs but rather were pre-Christian and non-Christian customs taken up by the Christian church. Saturnalia, a Roman feast celebrated in mid-December, provided the model for many of the merry-making customs of Christmas. From this celebration, for example, were derived the elaborate feasting, the giving of gifts, and the burning of candles. Lights also played an important part in most winter solstice festivals. The giving of

gifts has varied considerably, many peoples exchanging presents on other days and reserving Christmas solely for religious observances. The Teutonic yule feast also provided customs for the Christmas festivities, such as the yule log and wassail bowl. In many places a part of the yule log is retained to light the yule log of the following year. The origin of the Christmas tree has been variously traced; however, the tree was not in wide usage until the 18th century. The Saxons made use of ivy and holly, and mistletoe in such festivities is a Celtic remnant. Nativity plays early became a part of the Christmas celebration, and about the 13th century merry songs on religious themes became an important part of the Christmas activities. The representation in church of the crèche is said to have been begun by Saint Francis. The sending of Christmas cards by way of friendly greeting and remembrance has grown up since the middle of the 19th century. In the United States the customs and traditions of many nationalities and faiths have gradually blended into common usage forming a new tradition.

CHRISTMAS CAROL, A, short story by Charles Dickens, published in 1843, which has become one of the most beloved stories of Christmas in English fiction. On Christmas Eve, Ebenezer Scrooge, a selfish, disagreeable merchant in London, returns to his living quarters with no thought of celebrating the holiday season. He has spurned an invitation to spend Christmas with his nephew Fred, and only begrudgingly granted a one-day holiday to his underpaid clerk, Bob Cratchit. When a request for charity is made of him in the name of his dead partner Jacob Marley, he answers that the Christmas spirit is wasteful and foolish. After Scrooge goes to sleep, three apparitions appear to him: the ghosts of Christmas Past, Christmas Present, and Christmas Yet to Come. Their appearance results in a complete change in Scrooge, who becomes generous, kind, and thoughtful to relatives and his fellowmen on Christmas Day and for all days to come.

The most frequently quoted lines occur between Bob Cratchit and his crippled son, Tiny Tim. Bob makes the toast: "A Merry Christmas to us all, my dears. God bless us," to which Tiny Tim replies: "God bless us every one."

CHRISTMAS ISLAND, in the Indian Ocean, a hilly, isolated island 223 miles south of Java Head, owned by Great Britain. It is approximately 11 miles long and $4\frac{1}{2}$ miles in minimum width, the area being about 60 square miles. The hills, which rise to a height of some 1,000 feet, are covered with deposits of guano from which a considerable volume of phosphate of lime is derived. The employed persons, largely Chinese and Malays, work for the Christmas Island Phosphate Company, which exports the phosphate of lime. The island was known to the Dutch in the 17th century and was annexed by the British on June 6, 1888. It was placed under the control of the governor of the Straits Settlements in 1889 and incorporated with the Settlement of Singapore in 1900. The island was occupied by the Japanese for a time during World War II. Pop. (est. 1952) 1,639.

CHRISTMAS ISLAND, in the central Pacific Ocean, a low atoll of Polynesia, owned by

Great Britain, and situated in the Line Islands approximately 160 miles southeast of Fanning Island. Covering about 222 square miles, it is the largest atoll in the Pacific. The island was discovered in 1777 by Capt. James Cook, was annexed by Great Britain in 1888, and was included in the Gilbert and Ellice Islands Colony in 1919. It is on a long-term lease to a coconut plantation company, and copra is produced. The United States advanced claims to the island in 1856 and in 1936. Pop. (1950) 250.

CHRISTMASBERRY, an evergreen shrub, *Heteromeles arbutifolia* (also *Photinia arbutifolia*), native to California and Lower California and used widely for ornamental purposes. It customarily reaches a height of 5 to 15 feet. The thick, dark green leaves are oblong in shape, with sharp-toothed edges, and average about four inches in length. The flowers are white and the berries yellow or bright red, the latter being widely used as Christmas decorations. The Christmasberry is often known as the toyon.

CHRISTOFFEL, kri-stôf'ël, **Elwin Bruno**, German mathematician: b. Montjoie (now Monschau), Germany, Nov. 10, 1829; d. Strasbourg, Germany, Mar. 15, 1900. Professor of mathematics at Zurich, Berlin, and Strasbourg (after 1872). Christoffel did much significant work in higher mathematical analysis and mathematical physics. The Christoffel symbols, which play an important role in the theory of quadratic differential forms, are named after him.

CHRISTOLOGY, kris-tôl'ô-jî, the doctrine of the person and work of Christ, that is, his nature, both human and divine, his incarnation, his revelation of God, his miracles or "mighty works," his death (which effected the atonement or redemption of mankind from sin), his resurrection and ascension, his glorification, his heavenly intercession, and finally his coming again in glory to hold the Last Judgment.

The Creedal Statements.—The old Latin baptismal creed known as the Apostles' Creed, whose earliest form can be traced back to the 2d century, affirms the Christian belief "in God . . . and in Jesus Christ his only Son our Lord; who was conceived by the Holy Spirit, born of the Virgin Mary, suffered under Pontius Pilate, was crucified, died, and was buried; he descended into Hades; the third day he rose again from the dead; he ascended into heaven, and sits at the right hand of God the Father Almighty; from thence he shall come to judge the living and the dead."

The so-called Nicene Creed (q.v.), which is really a modification of the creeds formulated at Nicaea in 325, and at Constantinople in 381, amplifies this doctrine as follows: "We believe in one Lord Jesus Christ, the only-begotten Son of God, begotten of his Father before all worlds, God of (literally from) God, Light of Light, true God of true God; begotten, not made; consubstantial with the Father; by whom all things were made; who for us men and for our salvation came down from heaven, and was incarnate by the Holy Spirit of the Virgin Mary, and was made man. He was crucified for us under Pontius Pilate; he suffered and was buried; the third day he rose again according to the scriptures; and ascended into heaven. He sitteth at the right hand of the Father; and he shall come again with

glory, to judge both the living and the dead; and His kingdom shall have no end."

The so-called Athanasian Creed, which was really a 6th century anti-Priscillianist formula, probably from Spain or southern Gaul, is concerned chiefly with the exact definition of the relations between the Father, the Son, and the Holy Spirit, the three "persons" within the Blessed Trinity. Taken for granted in this creed is the earlier doctrine of Christ's deity, such as the statement adopted at the Council of Chalcedon in 451 that Christ has two natures, human and divine, which are united "inseparably" (*adiare-tōs*) and yet "unconfusedly" (*asynchytōs*), and that he is both "truly" (*alēthōs*) God and "perfectly" (*teleiōs*) man. These four terms set the boundaries of speculation for all later orthodox theology.

But it is not only in the creeds, or in the systematic theology which expounds them, that the doctrine of Christ is set forth. Hymns, prayers, homilies and sermons, the liturgy, devotional books, and works of art likewise state it, two important examples of the latter being *The Imitation of Christ* by Thomas a Kempis and Johann Sebastian Bach's *Jesu, Joy of Man's Desiring*. Like all basic or fundamental religious doctrines, this doctrine of Christ too is no mere result of theological speculation or of rational inference from sacred texts; it expresses the deep personal conviction and faith which lie at the heart of the Christian religion.

Conceptions and Titles of Christ.—The origin of this conviction can be traced in the New Testament, where the disciples of Jesus, who at first looked upon him as a teacher and prophet, "mighty in word and deed, and in favor with God and all the people" (Luke 24:19; Acts 10:36-38), came to believe that he was the Messiah (or Anointed), the glorious future king of Israel who was to inaugurate the reign of God over the whole world (Mark 11:9-10; John 12:12-16; 1:41; Acts 1:6). As reflected in the Gospels, this growing faith was essentially a religious conviction, derived from the impression of Jesus' teaching, character, "mighty works" of healing and exorcism, and the authority (Matthew 7:29) with which he spoke and acted as God's agent and representative. His works of healing and exorcism were proofs, not of personal prerogatives so much as of the approach of the divine reign or "the kingdom of God" (Matthew 12:28), although the implication that Jesus is "more than a prophet" is also clear (as in Matthew 11:2-6, where Jesus does not define his own title explicitly—he is simply "the coming one").

In lieu of signs and wonders, which men desired to see as evidences of supernatural authority, Jesus himself was the "sign" to his generation (Mark 8:11-12; Luke 11:29-32). The heart of Jesus' message was the proclamation of the near arrival of the kingdom of God; his mission consisted in preparing men to enter it, in "binding the strong man," and in rolling back the powers of darkness. It was all but inevitable that his disciples should look upon Jesus as the destined Messiah (Mark 8:27-30).

At the same time the Gospels bear witness to the early use of another term, "The Son of Man," which had even more exalted supernatural connotations (Mark 13:26). In the Jewish Bible, the term "son of man" meant simply "human being" (Ezekiel 3:10; Psalms 8:4); but the title "*The Son of Man*" (derived from Daniel 7:13) had

come to mean, technically, as in the Book of Enoch (46:3-6), the heavenly being who was with God when He created the world, and who will come on the clouds of heaven to judge the world on the Last Day (Matthew 25:31-33)—a figure reminiscent of Zoroastrian speculation. In the Gospels (for example, Mark 8:38; 14:62) this title is implicitly claimed by Jesus, although the references to his impending rejection, sufferings, death, and resurrection (as in Mark 8:31; 9:31; 10:32 ff.) only hint at the identification, and may be later insertions into the tradition. They stress the tremendous paradox of the cross: the divine, heavenly Son of Man must die! Whether or not the disciples already looked upon Jesus as The Son of Man, in addition to viewing him as the Messiah, is uncertain, as is also the precise sense in which Jesus used the term. But after the Resurrection there was no hesitation in ascribing to him the more transcendent title, with its connotations of exaltation, divine rank, and future coming (*parousia*) to hold the final judgment.

In the earliest stage of Christian doctrinal development, in the early Christian-Jewish communities in Palestine, this concept was normative. The ancient Aramaic invocation which survives in I Corinthians 16:22 attests this early Christology: *Marana tha*, meaning "Our Lord, come!" (cf. Revelation 22:20; Didache 10:6.) The title is not so much theological as religious, and reflects the faith of the early Christians in Jesus as a divine, supernatural being, upon whom all their hopes of salvation, both here and hereafter, depend. This faith requires expression, and the only adequate term available to the early Palestinian Christian-Jews, who were monotheists, and whose Bible was the Old Testament, was this transcendental one found in contemporary apocalyptic writings.

It was when the church spread beyond the borders of Jewish territory, to the east and west outside Palestine and also outside the settlements in the Jewish Diaspora, especially in the West, that other terms or titles became necessary. "Son of Man" was not understood by Greek-speaking Gentiles: to them it seemed to mean "the son of the man" or "son of a man," since they were unfamiliar both with Semitic idiom and with the Jewish apocalypses. Even the term "Messiah" was meaningless; it meant, literally, "anointed with oil" (*chrism*), and was either merely transliterated into Greek or, if translated, was understood either as a proper name or as a bizarre Oriental title. *Christos*, often confused with the Greek word *chrēstos* (gentle).

In the letters of Paul and also in Hebrews, "Christ" is used almost exclusively as a proper noun, part of the name "Jesus Christ," and no longer as a title, although its divine connotations are retained. Paul never uses the title "Son of Man," "Messias" (the Greek transliteration of Messiah), or "King of Israel," nor does he use the title "Rabbi" for Jesus. The great Christological passage in Philippians 2:5-11 might suggest the eschatological title, "Son of Man"; but instead the title used is "Lord." (I Corinthians 15:47 is sometimes cited as an example; but here no title appears, and the passage is an exposition of Genesis 2:7.)

It was inevitable that the Greek-speaking Gentile churches should use Greek religious terms and titles, and they chose those which were richest in meaning. "Son of God," which was not a common Messianic title among the Jews in

spite of Psalms 2:7, was perhaps the earliest to be adopted. "Saviour" (*Sōtēr*), another such title, had the advantage of being equally applicable to a divine or to a human being, and therefore to one who was both. Commonest of all, in the early Gentile churches, was "Lord" (*Kyrios*), which meant, in religious circles, the head of a cult, a divine being who was worshiped by a group, such as a city, a nation, or, later, a church. It was also known to Greek-speaking Jews and Christians as the translation of the Hebrew name for God (*Yhwh*) in the Septuagint. The earliest Gentile creed was probably simply "Jesus is Lord" (1 Corinthians 12:3), or possibly *Kyrios Christos* ("Christ is Lord"). The consequence of the adoption of this title, which would have been impossible in Palestine (though *Mar*, in 1 Corinthians 16:22, approaches it), was that many passages in the Old Testament referring to God were interpreted as referring to Christ. Finally, in circles where Gnostic or theosophical speculation was growing, the term "Logos" (Word, Thought, Reason, Purpose, or Utterance of God) was adopted (John 1:1-14; in Colossians 1:15-20 the idea is present, but not the term).

The term "Logos" was originally derived from philosophical speculation, and was widely popularized by Stoic teaching; however, its use, in the 1st century, was not limited to the philosophers. The idea of a divine Logos was found in many different cults and sects, as an expression of the principle of mediation between God and the world, not only in creation but also in the maintenance of the universe (Colossians 1:17).

Other titles were used in the Gentile churches, some of them derived from the Old Testament, as Mediator, Sacrifice, Lamb of God, Passover, High Priest, Prince, Captain, Child of God, Servant of God; others from the noblest religious teaching and aspiration in the Gentile world, as Invincible Sun, Splendor of God, Life, Light, Water of Life, Living Bread, Master, King, King of Kings; and still others from the church's own creative spiritual and devotional activity.

The variety in the titles applied to Christ by the early church is surprising. They match, and even exceed, those ascribed to the other deities in the ancient world. The church was entering upon its whole inheritance, not only from Judaism and the Old Testament, but also from the age-old religious devotion and aspiration of the entire civilized world. It used to be maintained that the church abandoned the purity of its pristine faith, as it spread through the Graeco-Roman world; that it accommodated itself to Greek, Roman, Egyptian, and Syrian mythology, and let its message be silenced and neutralized by philosophical speculation, until, eventually, the long centuries of controversy completely stifled the original gospel of Jesus.

But modern scholarship recognizes that these controversies were inevitable. The variety in the conceptions of Christ set forth even in the New Testament, the philosophical or scientific problems which they set (chiefly the profoundest problem of all: How can one person be both God and man?), the necessary reinterpretation of the Old Testament from the standpoint of the Christian view of Christ (especially as "Lord"), the requirement of a whole new set of terms for expressing the Christian dogma (or of old terms, such as "nature," "person," "substance," "will," with new meanings)—all these were problems which no Greek of the 2d to 5th century could

leave unsolved, whatever the cost in time, effort, or equanimity.

Moreover, modern research in social psychology and the history of religions has shown that the symbols used by the early church (especially those of Messianic King, Saviour, Redeemer, Revealer, Lord, Final Judge, Son of Man, Logos, and High Priest) have deep and permanent significance for the total life of mankind. They belong to the primeval structure of human thinking; what the church did was to provide for these basic needs a supernatural satisfaction.

Christological Controversies.—The Christology of the 2d century was partly adoptionist, that is, Christ *became* God by virtue of his noble character, pure teaching, and martyr death; this view simply applies the popular euhemerist explanation of the pagan gods as deified men, who had been founders of cities, inventors of arts, benefactors of mankind, or heroes. It was also partly monarchian, viewing God as a single Person, a unitary mind or will, who nevertheless manifested himself in different modes (hence modalism), such as the Father, Son, Spirit, Saviour, or Lord. This view reflects the influence of another type of pagan thought, in which Zeus, Jupiter, Jove, Amon, and Baal were merely different names for the one true God, who was nevertheless known to different nations under these different names. But as against both adoptionism and modalism (modalistic monarchianism), the church insisted on the true deity of Christ and his distinction in person from the Father. Neither monarchianism nor Gnosticism, which was also rife in the 2d century, contributed, except negatively, to the development of Christology.

The long period of Christological controversy opening in the 4th century was inaugurated by the attempt of Arius to define Christ as the "first of creatures," meaning a created and not an eternal being. Arius took his start from Paul's phrase, "the firstborn of all creation" (Colossians 1:15), from which his inference followed that "there was a time when the Son was not." This view provoked widespread controversy the orthodox doctrine being defended almost single-handedly by Athanasius of Alexandria (*Athanasius contra mundum*). The Arian doctrine was branded as heretical and rejected at the Council of Nicaea in 325. (See also ARIANISM.)

Once the relation of the Son (Christ) to the Father was defined—the Son being viewed as eternal, begotten before all creation and distinct in person from God the Father though one with him in substance, nature, and will—it became necessary to define the relation between the divine nature and the human in the Incarnation of the Son. Although the controversies were greatly complicated by political motives and by the rivalries of different schools and patriarchs, the main alternative answers were theological. By some it was held impossible to think of the divine and human natures of Christ as distinct: God could not be a child, or have a mother, or grow in grace! Therefore Christ's divine nature must have swallowed up the human, as a drop of water merged in the ocean; or the divine nature must either embrace or supplement the human, with a resulting unity and homogeneity; or form a single new nature combining both.

But the church as a whole, clinging firmly to scripture and tradition, refused to accept any of these alternatives and thus sacrifice the his-

torical reality of Jesus' true human nature, the distinction of his human person from God, and his distinctiveness from all other human persons. The views of Eutyches and Nestorius, of Apollinaris of Laodicea and Theodore of Mopsuestia, and of Sabellius and Paul of Samosata were rejected by the majority decisions of successive councils. The resulting definition of the nature of Christ (strongly influenced by the dogmatic letter which Pope Leo I sent to Flavian of Constantinople in 449, just before the Council of Chalcedon in 451) was highly metaphysical and difficult to conceive—like many of the formulas in mathematics and physics—but it safeguarded (1) the cardinal and essential monotheism of the Christian faith; (2) the truth of divine revelation; (3) the historical reality of Jesus' human nature, character, life, and teaching; and (4) the distinction between the divine Persons in the Blessed Trinity. The solution was not a compromise, but a safeguard of the essential truths of the Christian faith. Although strictly unimaginable and indescribable, the distinction between the divine Persons and the union of the two natures in Christ were principles which (granted the meaning of the language used in that long era of controversy) simply could not be abandoned if Christianity was to continue what it had been from the beginning: faith in God as revealed in Christ.

Later developments in Christology included Monothelism, which found the unity of Father and Son in the unity (identity) of two wills; Unitarianism, for which Christ is purely human, though possessing "divine" qualities of character, leadership, and heroism; such modern theories as Ritschlianism, in which Christ has the "value" of God, or the view of William Sanday that Christ's relation to the Father existed in his "subconscious"; and many others, ranging from an *avatar* in a long series of divine manifestations to the projection of a "Christ Idea," the "Christ myth" theory of the early 1900's. None of these later views, however, is characteristic of the main stream of historical Christian theology.

FREDERICK C. GRANT.

CHRISTOPHE, Henri, king of Haiti: b. Grenada, West Indies, Oct. 6, 1767; d. Oct. 8, 1820. He was an African slave who received his freedom as a reward of faithful service. On the outbreak of the Negro insurrection in San Domingo, 1791, he became one of its leaders, and attracted by his energy and ability the attention of Pierre Dominique Toussaint L'Ouverture, who conferred upon him a divisional military command. After the deposition of Toussaint, Christophe served under his successor, Jean Jacques Dessalines, and waged a war of increasing feroc-

ity against the French, who in 1803 were compelled to evacuate the island. In 1811 Christophe obtained undisputed possession of a portion of the island, and was proclaimed Henri I, king of Haiti. His reign was despotic and sanguinary. See also **HAITI**.

CHRISTOPHER, krīs'tō-fēr, **Saint**, a saint whose name and feast are celebrated, but whose history is little known. He is reported to have been a native of Syria, who was baptized by Saint Babylas, bishop of Antioch, and received the crown of martyrdom in Asia Minor about the middle of the 3d century. Relics of him are found in several places, principally in Spain. The Eastern Church celebrates his festival on May 9; the Western on July 25. His intercession was particularly sought in the time of the plague. Christopher literally means "bearer of Christ." He is represented as a giant, bearing the child Jesus upon his shoulders over a stream, which refers to a legend of this saint.

CHRISTOPHER, antipope: r. 903–904. A cardinal priest, he imprisoned Leo V and seized the papal throne, but in turn was ejected by Sergius III, who ordered his and Leo's execution. Roman tradition placed him in the list of legitimate popes, but now he is considered an antipope.

Consult Duchesne, L., ed., *Liber Pontificalis*, vol. 2, p. 235 (Paris 1892).

CHRISTOPHER NORTH, pseudonym of John Wilson, the Scottish author (q.v.).

CHRISTOPHLE, Abert Silas Médéric Charles, French politician and administrator: b. Domfront (Orne) 1830; d. Paris, 1904. Named prefect of Orne in 1870, but resigned; elected to the National Assembly in 1871 and 1887. In 1876 he became minister of public works and was named governor of the Crédit foncier de France 1878–1895.

CHRISTOPOULOS krē-stō'pōō-lōs, **ATH-ANASIOS**, āth'ā-nā'shī-ōs, Greek lyric poet b. Kastoria, Macedonia, 1772; d. Wallachia, Jan. 29, 1847. He studied medicine and the sciences at Budapest, and finally settled at Hermannstadt in Transylvania. An epicurean, he celebrated sensual indulgences in his *Erotika and Bacchika*, or *Love and Drinking Songs*, which have been several times collected and printed under the title of *Lyrika*. Though partly modeled upon Anacreon and the songs of Alexis Piron, Marc Antoine Désaugiers and other French authors, they display so much ease and simplicity, tenderness and grace, as to entitle him to the name of the modern Anacreon.

CHRIST'S HOSPITAL (generally called the Blue Coat School, from the costume of the pupils), a school in London, founded by Edward VI, for supporting poor orphans. There used to be from 1,000 to 1,200 boys and girls at this establishment receiving instruction, board and clothing, the girls being comparatively few in number. The ages varied from 8 or 10 to 15 or 16, five of the best scholars being sent each year to Oxford and Cambridge. An entirely new scheme of management came into operation in 1891, according to which the preparatory school (established in 1683 at Hertford) has 120 pupils, the boarding school for boys 700, and the girls' school 350; a day school for 600

boys, and another for 400 girls being also provided for. No Blue Coat boy ever wears a hat or cap, winter or summer. They wear knee breeches, yellow stockings, and long blue coats with a leather belt. Entrance to the Hospital schools is partly by nomination or presentation, partly by competition; and in regard to two thirds of the scholars, fees may be charged if the parents or relatives are judged to be able to contribute to the child's education and maintenance. Numerous exhibitions and prizes still remain, including exhibitions to the universities. Situated in Newgate Street, London, since 1552, Christ's Hospital was pulled down in the year 1902 and the institution removed to Horsham.

CHRIST'S-THORN, a small thorny shrub of the order Rhamnaceae, or buckthorn family. The most common, *Paliurus spina-christi*, flourishes in the southeast of Europe and Asia Minor, especially in Palestine. The spines are long and sharp, growing on slender vine-like branches, the flowers rose-shaped. The plant derives its name from its being believed to be the plant from which the crown of thorns was made which was placed on the head of our Saviour. The fruit is called jujube, *Zizyphus jujuba*.

CHRISTY, kris'ti, **Howard Chandler**, American artist and illustrator: b. Morgan County, Ohio, Jan. 10, 1873; d. New York, N. Y., March 3, 1952. After attending school at Dun-can Falls, Ohio, he went to New York in 1893 to study art under William M. Chase. He soon decided to be an illustrator. He went to Cuba during the Spanish American War and drew pictures of Teddy Roosevelt's "Rough Riders" in action. His illustrations appeared in *Harper's* and *Scribner's* magazines, and in *Collier's Weekly*, and he gained especial prominence with his "Men of the Army and Navy" series. He is, however, best known for his illustrations of the works of such authors as James Whitcomb Riley and Richard Harding Davis. Within a few years he had unconsciously created a feminine type, known as the Christy Girl. After 1920, he returned to portrait painting. He also painted *Signing the Constitution*, a large historical painting in the Capitol, Washington, D.C.

CHRODEGANG, krō'dē-gāng, or **GODE-GRAND**, gō'dē-grānd, **Saint**, bishop of Metz: b. about 700; d. Metz, March 6, 766. He was a descendant of a noble Frankish family. Pepin the Short, in 742, appointed him bishop of Metz. He was the author of the rule *Vita Canonica*. Feast day, March 6.

CHROMATES. See **CHROMIUM**.

CHROMATIC, in music, a succession of semitones, ascending or descending. The chromatic semitone is the interval between any given note and that same note raised by a sharp or lowered by a flat. The chromatic scale consists of 13 tones, the 8 scale tones and the 5 intermediate. It is believed by some that the term chromatic was adopted because the Greeks were in the habit of designating the intermediate ones by characters of various colors.

CHROMATIN. See **CELL**; **CHROMOSOME**.

CHROMATOGRAPHY, krō-mā-tōg'rā-fī,

is a method of chemical analysis which utilizes the differential countercurrent distribution of the components of a mixture between a fluid phase and an interfacial phase. In chromatography the distribution is commonly of the adsorption type occurring between a bulk phase (usually fluid) and an interfacial phase (usually fluid-solid); the term has been broadened, however, to include partition chromatography in which two fluid phases are used, the distribution involving a combination of liquid-liquid distribution and adsorption.

Credit is generally and properly given to Michael Tswett (Mikhail Semenovich Tsvett, 1872-1919), a Russian botanist, as the "true inventor of chromatography in all its important aspects." In 1906, Tswett, at the age of thirty-four, published an article in the *Berichte der deutschen botanischen Gesellschaft* in which he described with remarkable clarity and insight the general nature and scope of chromatography:

"There exists a certain adsorption sequence, according to which substances are able to replace one another. The following application is based on this law. If a petroleum ether solution of chlorophyll is filtered through a column of adsorbent (I use mainly calcium carbonate which is stamped firmly into a narrow glass tube), then the pigments, according to the adsorption sequence, are resolved from top to bottom into various colored zones, since the stronger adsorbed pigments displace the weaker adsorbed ones and force them farther downwards. This separation becomes practically complete if, after the pigment solution has flowed through, one passes a stream of pure solvent through the adsorbent column. Like light rays in the spectrum, so the different components of a pigment mixture are resolved on the calcium carbonate column according to a law and can be estimated on it qualitatively and also quantitatively. Such a preparation I term a chromatogram and the corresponding method, the chromatographic method. It is self-evident that the adsorption phenomena described are not restricted to the chlorophyll pigments, and one must assume that all kinds of colored and colorless chemical compounds are subject to the same laws."

Tswett's invention received scant attention in the scientific centers until the announcement in 1931 by Richard Kuhn and Edgar Lederer that crystalline plant carotene, long regarded as a single chemical compound, had been separated in macro amounts into two components by adsorption chromatography. Scientific interest in the carotenoids, because of their relationship to vitamin A, caused attention to be focused on the neglected technique of chromatography, with particular emphasis being placed on the development of techniques which would permit separation of mixtures of chemical compounds on the preparative scale. Since 1931 interest in chromatography as an indispensable laboratory aid has become worldwide.

Nature of Chromatography.—Adsorption chromatography employs the process of adsorption (the distribution of molecules between a fluid phase and a fluid-solid interfacial phase) in a countercurrent manner (the two phases move in opposite directions relative to one another). Any arrangement which utilizes countercurrent adsorption may be used: the adsorbent may be packed in a container of any shape; the fluid may flow in any direction, for example,

upwards or downwards through a column or radially through a bed. Moreover the fluid may remain stationary and the solid adsorbent be caused to flow in a definite direction through the fluid; or both phases may be caused to flow in opposite directions through one another. For simplicity and ease of control, the adsorbent is usually packed in columnar form in a glass tube, and the fluid phase containing the material to be analyzed is made to pass either up or down through the adsorbent.

In order to describe the nature of chromatography one may consider a hypothetical arrangement in which a solution consisting of a solvent *S* containing a chemical compound *X* (the solute) is introduced at the top of a column packed with adsorbent *C*. Compound *X* will possess a certain affinity for adsorbent *C* and a certain affinity for solvent *S*. (The affinity of the solvent for the adsorbent will be neglected in this consideration.) The ratio of the affinity of *X* for the fluid phase to its affinity for the interfacial phase is termed the distribution coefficient for *X*. If the distribution coefficient is 1, *X* tends to distribute itself equally between *S* and *C*; if the distribution coefficient is less than 1, *X* has a greater affinity for *C* than for *S*; whereas if the coefficient is greater than 1, *X* tends to accumulate in *S*. The distribution coefficient is dependent on the nature of *S* and of *C*, and on the chemical architecture of *X*, and, for the adsorption distribution, on the concentration of *X* in *S*, and on the temperature. As the solution percolates through *C*, *X* is brought into contact with the solid at the liquid-solid interface. Ideally, then, the amount of *X* in *S* and the amount of *X* adsorbed on *C* reach an equilibrium state. (In practice, equilibrium conditions are probably not ever established.) As the countercurrent process occurs, *S*, containing that amount of *X* remaining in solution, passes on to fresh *C*, permitting absorption of *X* from the solvent on the fresh adsorbent. Simultaneously, fresh solution comes in contact with the original zone of adsorption, and further adsorption occurs there. This process continues until all *X* is adsorbed and pure *S* passes out of the column. *X* will then be adsorbed in *C* in a discrete zone at or near the top of the column. If there are two or more solutes dissolved in *S*, they will all be adsorbed as described above. But, because of the competition among the different compounds for the liquid-solid interfacial area, the solutes that are more strongly adsorbed under the conditions employed will saturate the immediately available adsorbent and thus effectively displace the less strongly adsorbed materials. The latter will appear farther down the column as more or less discrete zones arranged in the order of their decreasing relative affinities for the adsorbent. As the final portion of the solution passes into *C*, fresh *S* (or a different solvent) is added at the top of the column in order to develop the chromatogram. When the fresh solvent passes through a zone of adsorbed material, desorption occurs, the adsorbed material passing into solution. This desorption and solution continues until equilibrium (ideally) is established between the amount of *X* in the solvent and the amount of *X* in the adsorbent. Then, as the solution containing desorbed material passes on to fresh adsorbent, adsorption again occurs as originally described. Thus the zone is carried in the direction of the fluid flow. The rate of movement of

the zone is dependent on the rate of fluid flow and on the distribution coefficient of the solute. The more strongly adsorbed material will move slowly relative to the solvent with a large distribution coefficient. In this manner complete separation of the zones may be achieved: that is, the chromatogram is developed. At this point the adsorbate may be extruded from the glass tube, and the zones separated mechanically. The adsorptives may be recovered from the sectioned zones by solution in an appropriate solvent; usually this solvent is one for which the adsorptive has a high affinity. Often, however, a more powerful developing solvent is added directly to the column to complete the passage of the zones from the bottom of the column where they may be collected as individual fractions. The developing solvent in this process is termed the eluent, and the process is known as elution analysis or liquid chromatography. A modification of elution analysis developed by Arne Tiselius is known as displacement analysis. This method utilizes a developing material which is more strongly adsorbed than any of the substances to be analyzed. Therefore, on addition of the developer, the zones representing the components of the original mixture are displaced by the developer and pass off the column as separate fractions. According to Tiselius' graphic description, the developing solvent acts as a sort of piston to push out the zones.

Partition Chromatography.—The method of partition chromatography for the qualitative and quantitative analysis of chemical mixtures was developed in 1941 by two English investigators, A. J. P. Martin and R. L. M. Synge. In this method two liquid phases are employed. One phase is sorbed on an inert support and is considered as the stationary phase. The mobile liquid phase passes over the stationary phase in a unidirectional flow so that countercurrent liquid-liquid distribution of the solute molecules occurs. (Generally, the liquid-liquid distribution is complicated by adsorption of the solute and mobile phase by the "inert" support.) Again, the components of the mixture to be analyzed can be characterized by a distribution coefficient which is defined as the ratio of the concentration of any given solute in the nonmobile phase to its concentration in the mobile phase. If the stationary liquid phase is considered analogous to the interfacial phase in adsorption chromatography, the nature of partition chromatography can be described as in the case of adsorption chromatography (see above).

Partition chromatography may be classified into bulk partition chromatography and paper partition chromatography. The former method employs a column of supporting adsorbent which has been equilibrated with the stationary liquid phase. A solution containing the different solutes to be analyzed is added to the top of the column followed by the addition of a suitable mobile liquid phase, that is, the developer. The analytical procedure is similar to that used in elution analysis. Martin, A. H. Gordon, and Synge have extended partition chromatography to include the use of paper strips and sheets as the supporting adsorbent whereby ultramicro amounts (of the order of 0.000001 gram) of material can be analyzed. In paper partition chromatography, the cellulose of the paper sorbs and holds aqueous solution as the nonmobile liquid phase. An organic solvent, saturated with water, the stationary solvent, is

used as the mobile developer. The mixture to be analyzed is applied in a small spot near one end of the paper strip. This end is dipped into a container of the mobile solvent, and the entire system is made airtight. The developing solvent flows along the paper by capillary action, either upward, downward, or across the paper, depending on the mechanical arrangements. After sufficient movement of the solvent, the paper is removed, dried, and examined by any suitable technique for the spots of the components of the analyzed mixture. In two-dimensional paper chromatography, a sheet of paper is used, and the mixture is applied in a spot near one corner. After development in one direction, the paper is removed from the container, dried, and developed with a different mobile solvent system in a direction at a ninety degree angle to the first direction, so that the individual spots of the substances separated by the first development now serve as points of origin for the second development. Greater resolution of mixtures is possible by two-dimensional analysis.

Technical Aspects of Chromatography.—Since the theory of chromatography has not developed sufficiently to permit accurate prediction of the action of any given adsorbent on any specific solute, the choice of adsorbent for investigational purposes is based largely on empirical trial. The adsorbent should have some selective action on the compounds to be analyzed. Further, it should be of a porous, stable nature with suitable particle size to furnish adequate contact with the adsorptives, and it is also necessary to select an adsorbent which has a high capacity but which does not bind the adsorptives reversibly. Preferably, the adsorbent should be colorless or white to permit ready recognition of the adsorptive zones. A partial list of adsorbents in use includes the activated charcoals, latomaceous earths, aluminas, sodium, magnesium, and calcium carbonates, sucrose, starch, silica, magnesium citrate, and 8-hydroxyquinoline. The recent use of exchange adsorbents (ion exchangers) in chromatography has given very promising results.

Only general considerations apply in the choice of solvents, including such age-old laboratory rules of thumb as "like dissolves like." Obviously, the solvent must be capable of dissolving the materials to be analyzed; but, equally obviously, the solutes must not be so soluble in the solvent that adsorption does not occur, nor the solvent so strongly adsorbed as to exclude solutes from the adsorbing surface. Solvents for development and solvents for elution analysis, when rapid removal of adsorptives is desired, should possess a great solubilizing action on the adsorptives. Moreover, solvents used in chromatography should not react irreversibly with the adsorbent or adsorptives. Among the many solvents employed are the aliphatic alcohols, ketones and ethers, aromatic and aliphatic hydrocarbons, and chlorinated aliphatic hydrocarbons.

Numerous techniques have been introduced for the location of zones on a column. Colored zones may, of course, be located visually. Colorless compounds may be converted to colored derivatives before chromatography. After development of a chromatogram containing colorless zones, the zones may be detected by application of reagents which react with the adsorptives to produce distinguishing colors. Colorless zones may often be defined by the fluorescence of the

adsorptive when the column is examined under ultraviolet light. Zones containing physiologically active materials may be detected by reference to standard biological assay methods. In elution and displacement analysis, the presence of the separated compounds in the collected fractions may be detected by examination of the fractions for any change in the chemical or physical properties such as hydrogen ion concentration, index of refraction, or conductivity.

The apparatus required for adsorption chromatography is simple indeed. The adsorbent is usually packed in a suitable glass tube. The only other necessary equipment is the usual laboratory glassware containers. Ingenious apparatus has been devised for use in paper partition chromatography. The reader is referred to the references at the end of this article for a full treatment of this subject.

Applications of Chromatography.—The versatility of chromatography may be emphasized by the following list of applications of the method:

- (1) Resolution of mixtures: identification, estimation, and isolation of components.
- (2) Concentration of solutes from dilute solution.
- (3) Purification of chemical compounds.
- (4) Determination of the homogeneity of chemical substances.
- (5) Control of technical products.
- (6) Determination of molecular structure.

CHESTER A. HARGREAVES II,
Department of Chemistry, Yale University.

CHROMATOPHORE, krō'mā-tō-fōr, a pigment cell. The possibility of change of color in the chameleon, frog, or the squid, is due to certain cells in the cutis which are filled with pigment. These pigment cells are called chromatophores, and under the stimulus of light may expand or contract. When expanded they are highly ramified and when contracted are roundish. The pigment differs in different individuals and in different parts of the body, being yellow, brown, black and at times even red or green. In the goby (a fish), the chromatophores, which are yellow or greenish-yellow when distended, become orange when contracted; while the orange or red ones, when shrunk, become brown or even black. In the same fish a still different kind of chromatophores are filled with iridescent crystals, which in expansion become visible as spots of metallic sheen. It is on the distribution and different depth in the skin of the chromatophores that the pattern of markings of the skin of changeable animals depend. In the common squid the chromatophores can be seen dilating and contracting, giving off a remarkable play of all the colors of the rainbow. The value of this power, which is under control, is that it gives the animal means of concealment by adapting its color to that of its surroundings.

CHROMATROPE, krō'mā-trōp, or **CHROMOTROPE**, -mō-, a toy consisting of a disc painted with arcs of circles in brilliant colors in such a manner that when the disc is revolved, centrifugal or centripetal streams of color seem to flow through it. The term is also applied to an attachment for a magic lan-

tern, by which, on the revolution of two painted discs of glass, kaleidoscopic effects are projected on the screen.

CHROMATYPE, a photographic picture in which the paper employed has been sensitized by some of the salts of chromium.

CHROME IRON ORE. See **CHROMITE**.

CHROME PIGMENTS. A number of valuable paint pigments are based on lead chromate, $PbCrO_4$, the most important being the following. *Chrome green* is mainly a mixture of lead chromate and the iron ferro- and ferricyanides, which are intensely blue in color. *Chrome yellow* is lead chromate with varying amounts of coprecipitated lead sulphate. *Chrome red*, or *American vermilion*, is a basic lead chromate containing either lead oxide, PbO , or lead hydroxide, $Pb(OH)_2$. The yellow color of lead chromate is modified to paler shades by white lead sulphate. On the other hand, increasing alkalinity shifts the color of lead chromate through orange to a brilliant red. The red pigments, however, are said not to have the covering power of the lighter shades.

Chromium trioxide, Cr_2O_3 , is an ingredient of green ceramic enamels, and, as a paint pigment is called "oil green" or "green cinnabar." Both the oxide and the hydrous oxide, $Cr_2O_3 \cdot 3H_2O$ are used as mordants in the dyeing and printing of textiles.

CHROME STEEL. See **CHROMIUM**; **SURGICAL STEELS AND ALLOYS**.

CHROMIC ACID. See **ELECTROPLATING—Chromium**.

CHROMITE, krō'mīt. The only important ore of chromium is chromite, although chromium occurs in a large number of other minerals. Chromite has a theoretical composition of $FeO \cdot Cr_2O_3$, containing 32 per cent FeO and 68 per cent Cr_2O_3 . Chromite is one of a group of isomorphous cubic minerals known as spinels, having the general formula $(Mg, Fe)O \cdot (Cr, Al, Fe)_2O_3$. The natural chromite deposits actually contain varying proportions of alumina, magnesia, lime, and silica, and Cr_2O_3 content varies from less than 30 per cent to more than 60 per cent.

Chromite occurs in a massive form with a granular structure and crystallizes in the isometric system in octahedrons. It is brittle and has an uneven fracture. It is fairly soft compared to other minerals, with a hardness of 5.5. Chromite has a density range of 4.1 to 4.9. Its color varies from dark brown to jet black. It has a luster approaching that of metals, and some chromites are feebly magnetic. The softening point of chromite varies from $2,300^\circ$ to $2,600^\circ F.$, depending on included impurities. It is chemically neutral and almost insoluble in most slags and acids, but its reactivity increases and its refractoriness decreases with increase in iron content.

Chromite deposits are found in ultrabasic rocks or serpentines that have been derived from them. It is often associated with nickel and cobalt, gold, platinum, titaniferous magnetite, magnesite, talc, and chrysotile asbestos.

The three principal uses of chromite are metallurgical, refractory, and chemical. In the United

States, consumption of chromite in 1952 was divided as follows: 57 per cent metallurgical, 33 per cent refractory, and 10 per cent chemical.

Metallurgical use of chromite is for the production of chromium and ferrochromium alloys. (See **CHROMIUM**.) Specifications for chromite for metallurgical use call for a minimum of 48 per cent Cr_2O_3 , and a chromium: iron ratio of 3:1. Silica is undesirable, and combined alumina and magnesia should be under 25 per cent. When ore of these specifications is unavailable, high- and low-grade ores are blended to obtain the most desirable mixture.

Chromite is used extensively for refractory purposes, and most of the ore is manufactured into brick. It is used mainly in basic open-hearth steel furnaces, at and below the slag line, to separate the acid brick of the roof from the basic brick of the hearth. Unlike other refractories, chromite is chemically neutral and resists attack by both acids and bases at high temperatures. In addition to brick, it is used in ramming mixtures for furnace bottoms and as finely ground ore for patching furnace walls. Refractory grade chromite contains about 63 per cent combined Cr_2O_3 and Al_2O_3 . Iron content should be about 10 per cent, and silica about 5 per cent. Iron and silica must be kept low, as refractoriness decreases with increase in iron content, and silicates lower the melting point. Desirable magnesia content is 17 to 18 per cent.

Almost all of the chemical use of chromite is for production of sodium dichromate which in turn is made into various compounds. The largest chemical use is for tanning leather, and the production of pigments. Another important use is for surface treatment of metals. (See **DICHROMATING**.) Chromite and other chromium compounds are used as coloring agents in ceramic glazes and in glassmaking. Chemical grade chromium contains 43 to 45 per cent Cr_2O_3 , and high iron content is accepted within reasonable limits. Silica should be less than 5 per cent. Ore for chemical purposes is used as fines and concentrates to facilitate disintegration during processing.

All of the chromite mined in the United States in 1952, 21,304 short tons, came from many deposits in California and Oregon, although Montana contains the major portion of United States reserves. Chromite occurs also in Washington, Wyoming, Pennsylvania, Maryland, and North Carolina. The Wood mine, in Pennsylvania, was the principal world supply in the early days of the chromite industry.

The major producers of chromite in 1952, in order of production, were Turkey, USSR, Union of South Africa, Philippines, Yugoslavia, New Caledonia, Cuba, Japan, Greece, Sierra Leone, United States, Pakistan, Cyprus. In 1952, the United States imported a record total of 1.7 million short tons of chromite, almost half of the world production, valued at \$38,082,753 of which 54 per cent was metallurgical grade, 35 per cent refractory grade, and 11 per cent chemical grade. The Philippines supplied 32 per cent of the total, Turkey 27 per cent, and Union of South Africa 18 per cent. Chromium ores enter the United States duty-free, but products do not.

CHROMIUM, krō'mī-ŭm. The element chromium, a metal, was discovered by Louis

Nicolas Vauquelin in 1797. The name used was a derivative of the Greek *chrōma*, color, because of the variety of colors associated with different chemical compounds of the element. Although Vauquelin worked with red lead ore, which is the mineral crocoite, PbCrO_4 , the only commercially important ore of chromium is chromite, $\text{FeO} \cdot \text{Cr}_2\text{O}_3$.

In producing chromium, chromite ore is first reduced to chromic oxide. The concentrated ore is heated with sodium carbonate to form sodium chromate, and ultimately sodium dichromate. Sodium dichromate is then reduced by sulphur or carbon to form sodium sulphate and chromic oxide, Cr_2O_3 . Chromium metal was first produced commercially from Cr_2O_3 by the Goldschmidt process, or aluminothermic process, by reduction with aluminum. This process is used extensively in the United Kingdom. Chromium metal is produced in the electric furnace by the silicon reduction of chromic oxide, and this method is favored in the United States. Chromium of higher purity is produced by electrolysis from chromic acid solutions. Recently a high purity chromium has been produced economically by electrolysis of solutions containing either chromite or high-carbon ferrochrome. Chromium has been produced on a laboratory or pilot plant scale by many methods including reduction of chromium chloride by magnesium, sodium, or hydrogen; reduction of chromium oxide by carbon, calcium, or hydrogen.

Ferrochromium, an alloy that is the basic vehicle for the addition of chromium to molten iron and steel, is produced in the electric furnace by reducing chromite ore with a carbonaceous agent. Low-carbon ferrochromium is produced by silicon reduction processes in many ways. In one instance, silica under the proper temperature and pressure conditions is used to oxidize and remove carbon from high-carbon ferrochromium.

Chromium plays an important part in the manufacture of alloy or special steels. In steels containing up to 3 per cent chromium, chromium is one of the most commonly used hardening elements. In steels containing 3 to 12 per cent chromium, chromium is used to impart high strength or increased resistance to oxidation at elevated temperatures. Chromium in excess of 12 per cent in steels results in the class known as cutlery steels and stainless steels, characterized by high corrosion resistance. In the group are the important austenitic stainless steels containing nickel in addition to chromium. The 18-8 stainless grades (18 per cent chromium-8 per cent nickel) offer resistance to oxidizing and reducing types of corrosion, and have exceptional physical properties.

Chromium is used with nickel in alloys for electrical resistance elements for heating. It finds important application in high speed cutting tools, refractory metals of the Stellite class, and in alloys developed for high temperature service in jet engines and turbo superchargers. It is also used as an alloying agent in nonferrous alloys of nickel, copper, aluminum, and cobalt.

Chromium plate on steel, in addition to its decorative effect, has the highly desirable properties of corrosion resistance, high hardness, and wear resistance. It has a shiny bluish silvery appearance. It is used extensively in the automotive industry, in the machine tool industry to increase life of working parts, and in the chemical industry to impart corrosion resistance.

Chromizing, a process similar in application to carburizing or calORIZING, is a method of coating steel with chromium to provide oxidation resistance at high temperatures. Low carbon steel parts are packed with a mixture of alumina and chromium powder and heated in a hydrogen atmosphere. A coating of chromium is built up on the steel part by diffusion alloying.

Total consumption of chromium alloys and metal in 1952 was classified as 63.3 per cent used in making steels containing over 10 per cent chromium, 0.4 per cent in high speed steels, 30.3 per cent in other alloy steels, 4.1 per cent in high temperature alloys, and 1.9 per cent in other uses.

Chromium, atomic number 24 in the periodic table of the elements, has an atomic weight of 52.01. It has a density of 7.19 grams per cubic centimeter, and melts at 1890°C . (3430°F). It has a body-centered cubic crystal structure, with other modifications reported. The compounds of chromium are colored, the color changing with change in oxidation state.

The chromous compounds (Cr^{++}) are not common, and blue hydrated chromous ions are oxidized by air or water to the chromic (Cr^{+++}) condition. Chromic compounds are stable and are similar to aluminum compounds. Chromic oxide, Cr_2O_3 , is a green crystalline solid with a high melting point and is used as an abrasive, refractory, pigment, and as a catalyst for certain reactions. Chromic hydroxide, $\text{Cr}(\text{OH})_3$, produced by precipitation from chromic solutions by hydroxide ions or hydrolysis of chromic compounds, is a good mordant and forms brilliant colored lakes with dyestuffs. It is also important in the tanning of leather. Chrome alum, $\text{KCr}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$, is also used in tanning leather. Complex chromic compounds are formed readily and in great variety because of the strong tendency of the triple-charged chromic ion to associate with molecules or other ions. See also ELECTROPLATING—Chromium.

CHROMOLITHOGRAPHY. See LITHOGRAPHY—Chromolithography.

CHROMOSOME, krō'mō-sōm. In 1888 Wilhelm von Waldeyer gave the name chromosome to certain deeply stained bodies in cell nuclei. They are now known to be a characteristic structure in all animal and plant cells. Even bacteria and yeasts have elements of a similar chemical nature. In 1902 Walter S. Sutton formulated the chromosome theory which recognizes that the behavior of the chromosome at reproduction provides the physical basis for Mendel's laws of heredity. Thus the chromosomes are of great significance to living beings, for they act as the carriers of the units of heredity, the genes.

Chromosomes are chemically and structurally complex. They are composed primarily of nucleic acids and proteins (chromatin) which absorb strongly certain wave lengths of ultra-violet radiation. They color intensely with a variety of stains, one of which, the Feulgen stain, is relatively specific for chromatin. During the various phases of cell division they undergo extensive alterations of shape which are interpreted as involving changes in water content. At the metaphase stage of cell division when the chromosomes are in their most compact form they com-

monly have the structural features shown in (D). The main body of the chromosome constitutes the matrix; within the matrix is a double-stranded coil, the chromonema; a primary constriction bears a kinetochore or spindle attachment granule; other constrictions may be present.

Every species has a fixed number of chromosomes, each one characteristic as to shape and relative size, see (A). Commonly sperm and egg cells contain one of each kind and are said to be haploid. After fertilization, the sperm and egg chromosomes are combined in a single nucleus, producing a diploid cell which has two of each kind. Each chromosome passes through a cycle of duplication at the time of cell division, or mitosis. (See CELL—Cell Division.) In the non-dividing cell they are elongate filaments which

(A) chromosomes of *Drosophila melanogaster*, a somatic metaphase in the female; (B) same in male *Drosophila*, chromosome IV at the arrow; (C) paired IV chromosomes of *Drosophila* salivary gland (after Bridges); (D) diagram of a metaphase chromosome showing matrix, chromonema, primary constriction bearing kinetochore and secondary constriction; (E) (F) (G) prophase, metaphase, and anaphase of somatic mitosis; (H) through (K) stages in the first meiosis; (H) is before pairing; (I) is the pairing stage, synapsis; (J) is the diplotene; and (K) is one possible pattern of the anaphase of the reduction division; (L) diagrams of the process of crossing over which occurs during synapsis; (M) pairing between a normal chromosome with genes in the order *a, b, c, d* and a chromosome with an inverted segment with genes in the order *a, b, c, d*.

shorten progressively during the prophase, the early stages of division, see (E). In the following stage, metaphase, see (F), they become compact bodies which color intensely in the killed and stained cell or stand out in strong contrast in the phase microscope. Each metaphase chromosome is composed of two halves, presumably parent and replica, so that when the halves separate in the anaphase, see (G), each daughter cell gets an identical chromosome set and a complete set of genes. The significant feature of mitosis is this precise replication of each chromosome which insures that all of the descendant cells shall have the same heredity, at least as regards nuclear genes.

The behavior of the chromosomes is different during the two divisions of meiosis than it is in

the ordinary mitosis described above. Meiosis occurs during gamete formation in most animals and during spore formation in most plants. The end result of the process is to produce haploid cells from diploid cells. During the prophase of the first meiotic division the chromosomes unite in pairs (synapsis) as shown in I, an event which prepares the way for the reduction in chromosome number. Pairing is a special feature of meiosis; it occurs only rarely in somatic cells. The second meiotic division resembles, in many respects, a somatic mitosis as already described. The details of the meiotic process are too varied and too detailed to be fully recorded in this place. It should be noted, however, that meiosis with its consequent reduction of the chromosome number to one half of the species number, is the logical complement of the process of fertilization which restores the diploid number.

The evidence that genes are carried on the chromosomes "like beads on a string" is extensive and compelling. Cytogenetic research which combines the study of chromosomes with breeding experiments has demonstrated that an exchange of segments often takes place between the paired chromosomes at synapsis. This phenomenon is called crossing over, and it is associated with corresponding changes in the inheritance of the genes involved in the crossover, see (L). Genetic studies of crossing over make possible the mapping of the position of genes on the chromosome. Chromosomes are broken by various means including X-radiation and treatment with chemicals. The detached pieces may recombine with the same or with other chromosomes, forming new gene associations (inversions, translocation) or the piece may be lost (deletions). Either abnormality produces aberrant hereditary types.

In some cells the chromosomes and their containing nuclei become extraordinarily large, as for example in the salivary glands of the fruit fly *Drosophila*. In these cells the nuclei are relatively enormous, the chromosomes are paired and are fortunately marked with transverse bands, C, so that it has been possible to identify the location of many genes with a considerable degree of exactitude. The two paired members are quite precisely joined so that band for band they correspond throughout their length. The forces which bring about the exact pairing of chromosomes are at present unknown. One of the best proofs of the linear order of the genes arises from the pairing figures which occur when a normal chromosome pairs with one which has an inverted segment as shown in M.

It has been demonstrated in many species of plants and animals including man that the sex of the individual is determined at fertilization. In the fruit fly, *Drosophila*, and in man, the sexes differ as regards one pair of chromosomes, see (A) and (B). The female has two x chromosomes; the male has an x and a y. Two different kinds of sperm are formed at the reduction division, x-bearing or y-bearing, and they are formed in equal numbers. In these species all mature eggs contain one x chromosome. A male results if a y-bearing sperm fertilizes any egg. A female results if an x-bearing sperm fertilizes any egg. The final differentiation of sex during the development of vertebrate animals is conditioned by endocrine factors.

CHROMOSPHERE, *krō'mō-sfēr*, the second layer of the so-called atmosphere of the Sun. The true surface of the latter, which is what we actually see when we view the Sun—the atmospheric layers being transparent to the eye—is called the photosphere. Above it, in order, are the reversing layer, the chromosphere, and the corona. As even the main body of the Sun is gaseous, it must be understood that there cannot be any sharp division between the above-mentioned layers, such as between the Earth's surface and the air above it. Though the boundaries are somewhat indefinite, still each layer mentioned has inherent properties and it is quite proper to speak of them as actually distinct. The solar radius is about 432,000 miles; the reversing layer is generally considered to have a thickness of less than 200 miles; the chromosphere is perhaps 10,000 miles thick. The inner corona reaches out fully 200,000 miles, and the streamers of the outer corona stretch out to many million miles in some cases.

The first reference to what may be considered chromospheric phenomena, namely prominences, seems to have been in 1706, but the first quite complete account was not given until 1846, both of course during total solar eclipses. The first profitable study of such phenomena, using spectroscopic means, was made by Jules Janssen at the eclipse of 1868 and shortly thereafter by Joseph N. Lockyer, without an eclipse. At the Spanish eclipse of 1870, Charles A. Young of Princeton first fully observed the so-called flash spectrum, which permits an analysis not only of what elements are present but also gives the means for determining their abundance and how high each extends above the solar surface.

It is practically impossible, for our purposes, wholly to separate the reversing layer and the chromosphere; indeed the former is from many standpoints merely the lower and denser part of the latter. Hence the flash spectrum refers to both. However, to make the discussion intelligible, something must be said about the spectroscopy and how it is employed in such work. If we photograph the spectrum of the Sun we find a continuous background running from violet to red, crossed by many thousand dark lines. These latter are caused by absorption in the reversing layer. But at total eclipses, just when the Moon's disk has wholly covered the Sun, part of the solar atmosphere becomes visible for a moment as the main body of the Sun is shut out. To the eye this would appear scarlet, because of the hydrogen, but what first called attention to it were scarlet protuberances which went out for some distance and often resembled tongues of flame. These are now called prominences and may be seen at every total eclipse. They were so brilliant at the Indian eclipse of 1868 that Janssen believed he could see them in full daylight. The principle is this: we do not see them on any clear day simply because our atmosphere is too bright close to the Sun. But the spectroscope, as dispersion is increased, makes the continuous solar spectrum longer and hence fainter per unit area. However, as the prominences consist of only a few gases and their light is concentrated in characteristic bright lines, more dispersion

merely sets these lines further apart without making them fainter. A time will come evidently when the lines will be brighter than the background. So by opening his slit somewhat, Janssen was able to detect the prominences in full sunlight. Lockyer, in England and wholly independently, hit on the same idea two months later. From that time on, prominences could be observed without eclipses. As to the chromosphere itself, its chief constituents are hydrogen, helium, and ionized calcium. It is true many other elements are also found, especially at lower levels, but those mentioned are most characteristic. The pressure is unbelievably low, being estimated at one ten-millionth of an atmosphere at the lower level, and 1,000 times less near the upper. One may wonder why calcium, a rather heavy element, is so conspicuous, but in its ionized state it is particularly susceptible to radiation pressure, and it is believed that the latter holds it up against solar gravitation, which is 28 times as great as at the Earth's surface.

The work of Young in 1870 proved that, once the Sun's disk was covered, the lines caused by the chromosphere instantly appeared bright and coincided in position with the dark lines seen in the usual spectrum. The next great advance was made by Henri Deslandres of France and George E. Hale in America, each inventing independently about 1890 what is now called the spectroheliograph. The principle involved here is the same one used in getting a spectrum of the Sun with a spectroscope. But just in front of the photographic plate a metal plate is fixed which contains a narrow slit. This plate can be displaced laterally until the second slit comes to any given line in the solar spectrum. Always one of the wider or more prominent lines is chosen, such as C of hydrogen or H or K of ionized calcium. With high dispersion these lines have an appreciable width. Hence if the second slit is made very narrow, the center of a given line, its edge, or halfway between may be isolated and photographed. From well-known principles, light from the edges comes from the lowest level visible, the center from the highest level, and the intermediate position from perhaps halfway up in the chromosphere. Then by having a slit long enough to reach across the solar disk, and by slowing the telescope's driving clock slightly, one can photograph the solar atmosphere all across the Sun, not only in light of one element but also at three different levels showing the distribution of the element in question. In this way superb photographs are obtained showing the distribution of the elements at various levels.

The prominences used to be simply divided into quiescent and eruptive, but now sharper designations are needed in technical discussions. The simpler are adequate for our purposes. Quiescent are generally larger than eruptive prominences, move more slowly, and have a wider distribution over the disk. They are largely made up of the three main chromospheric elements. The eruptive are frequently found in the sunspot zones, they also show many other elements in their constitution, and their shapes change rapidly. A few have been seen to rise almost to a solar radius, the record being 1.22 radii, and their radial velocities can attain many hundreds of kilometers per second. The latter record is 750 kilometers per second. Their shapes and behavior are most varied. As undoubtedly some

are cooler than the background, they show up on the spectroheliograms as fantastic dark shapes some of which resemble earthworms.

In recent years it has been possible to secure moving pictures of prominences and what one sees is, in some cases, almost unbelievable. Frequently the prominences move out from the solar surface in curves which strongly resemble magnetic lines of force and so continue until they return, thus completing the curve. For others the material seems to go out for some distance beyond the highest point of the arch and then, instead of going forward, seems to reverse its direction and go backward. Again we see in a region above the solar surface, which seems utterly devoid of material, a formation suddenly appear and the material pours down. Others resemble geysers or ornamental fountains in their behavior. If one takes a single exposure on some of the more fantastic shapes they strongly resemble the skeletons of prehistoric monsters or giant birds. Two other phenomena known as flares and spicules must be mentioned. The former consist of a sudden brightening of part of a bright flocculus near a sunspot. In hydrogen light, in a very few minutes, this becomes quite the most brilliant point on the Sun. They rarely last but a few hours and generally subside very rapidly, the surrounding area showing little effect of what happened. They are intimately connected with fadeouts in short-wave radio transmission. The latter is probably caused by an excess of ultra-violet radiation from the flare which ionizes our upper atmosphere. The spicules are sharp, small, and bright and are seen all over the Sun, even in the polar regions where spots never occur and many other phenomena are uncommon. The brightest go up about 4,000 miles and rarely last more than 10 minutes. There must be vast numbers on the Sun at any given moment.

Some of the most curious results of solar research are concerned with temperatures. For some decades scientists have agreed that the photospheric temperature is about 6000°K. (absolute centigrade degrees). But it was naturally thought that temperatures in the upper layers of the solar atmosphere would be lower. Remarkable work on the identification of lines in the solar corona with metallic gases which had undergone multiple ionizations of a high order first indicated the temperature there as of the order of a million degrees centigrade. More recent work on the chromosphere indicates that high temperatures are also found there. It is true that results from the three highly technical methods used do not agree well, in fact running from 30,000°C. to 175,000°C., but the significant thing is that all agree in giving a temperature vastly higher than the photospheric temperature. Both a description of the methods used and the tentative explanations of the values derived are wholly out of the scope of a general descriptive article. In fact, while more and more information about the Sun is being found and while acceptable theories for the maintenance of its radiation are now at hand, anything like complete or satisfactory theories as to what goes on beneath the photosphere, causing sunspots and other phenomena, and much of what goes on above it, some of which has just been briefly described, still remain to be formulated.

Consult Mitchell, S. A., *Eclipses of the Sun*, 5th ed. (New York 1951); also any general astronomy published

since 1945. Advance in solar research has been so rapid that practically all older works are out of date. *Transactions* of the International Astronomical Union contain résumés of all recent work. Technical journals on astronomy have much on the Sun.

CHARLES P. OLIVIER,

Director, Flower and Cook Observatories, University of Pennsylvania.

CHRONICLE, krōn'ī-k'l, a history recounting in order of time all details which observation or tradition has furnished the author. It may be a universal history, or may deal with a single epoch, nation, city, or individual. Some chronicles have been preserved from early ages. The Old Testament Chronicles are a type of such.

In the early Christian ages, ecclesiastics were generally the authors of the chronicles. Most of the medieval chronicles were by monks who usually began their story with the Creation, followed by an abridged history of events from the first chapter of Genesis to the immediate subject of their narrative. They usually did not distinguish fact from fiction, were not inclined to question much either visions or miracles, and were accustomed to dwell as long on unimportant as on momentous events. Chronicles are valuable for determining historical facts when they contain materials from older works which are now lost, or when they relate events contemporary with a writer, and of which he was a witness; and they are always valuable as an illustration of the spirit of an age and the sentiments of a people. It is through them that nearly all the history of the Middle Ages has been preserved. Every European people has numerous medieval chronicles.

France is rich in chronicles written in Latin, French, and various provincial dialects. The first of the chroniclers who wrote in the popular language of France was Geoffroi de Villehardouin who lived in the 12th century and was an actor in the events which he describes. Froissart's *Chronicles* (q.v.) embrace the events occurring from 1325 to 1400 in England, Scotland, France, Spain, Brittany, and the Low Countries, setting forth in detail the feasts, spectacles, and all the pageantry of feudal times, and enlivened throughout by Froissart's shrewd observations.

Of the strictly English chronicles, the *Historia Regum Britanniae* by Geoffrey of Monmouth, a monk of the 12th century, is of particular interest because it tells of King Arthur more fully than any previous work. Geoffrey also traced the history of Britain through a series of imaginary kings from Brutus, a son of the Trojan Aeneas, who founded the British state many centuries before the Christian era, to Cadwaladr Vendigaid who probably died in 664 A.D. There is also the *Anglo-Saxon Chronicle*, extending from the beginning of the Christian era to the death of King Stephen in 1154. (See **ANGLO-SAXON LANGUAGE AND LITERATURE**.) The collection of chronicles edited by Raphael Holinshed from 1573 to 1578 and published in the latter year embraces a history of England up to 1575, a history and description of Ireland by Richard Stanyhurst, and a history of Scotland by Hector Boece. *The Chronicle of the Kings of England* by Sir Richard Baker, published in 1643, is a history of England from Roman times to the death of King James I.

CHRONICLES, Books of. The books of Chronicles were originally one book in the Hebrew, which is also true of Ezra and Nehe-

miah. Further, it is now a generally accepted conclusion that these two books, Chronicles, and Ezra and Nehemiah, were written by the same author and were, when composed, a single work. The reasons for this conclusion are the following:

Ezra is the direct historical continuation of Chronicles. Further, two verses at the end of Chronicles are repeated at the beginning of Ezra, a duplication which is supposed to have occurred when the division was made. Also, the characteristics of both works are the same. These are particularly a fondness for genealogies and also for the treatment of religious matters, especially those things which pertain to the temple and the work of the priests and Levites. Again, both are marked by the same unusual late linguistic peculiarities.

In Chronicles the passage which apparently indicates the latest date is I Chron. 3:19-24, where the sixth generation after Zerubbabel in the line of David is mentioned, which would be about 350 B.C. The text of the passage is, however, somewhat doubtful; the Septuagint reading indicates the 11th generation. Nehemiah contains clearer evidence of a late date. The high priest Jaddua, of the time of Alexander the Great, is mentioned, Nehemiah 4:10f, 22f. Further, the description of Darius as the Persian, Nehemiah 12:22, would be unnecessary and unnatural while the Persian empire was in existence, and implies that at the time of the writer that empire belonged to the past. Hence the writer lived probably about 300 B.C., but possibly later than that.

I Chronicles 1:9 contains the history of the Hebrews from Adam to Saul; 10-II Chron. 9, the history from the death of Saul to the death of Solomon; II Chron. 10:36, the history of Judah only, without Israel, to the end of the Babylonian captivity in 537. When this history is compared with the parallel accounts in the books of Samuel and Kings it shows many omissions and also many additions. The omission of the entire history of the northern kingdom, Israel, is specially notable. The whole of the material of II Sam. 9:20, except the account of the wars with the Ammonites, is omitted. This is particularly significant because the omitted portion gives an account of the failings of David and the unfavorable side of his court and family life. The additions are concerned chiefly with the activity of the Levites and the prominence of the temple and ritual matters. An example of a long addition is I Chron. 22, II Chron. 29, 30, of which only 29, 23a, 27, is from a known source, i.e., from I Kings. The additions show an idealized view of the history, representing the P code as in force in the time of David.

It is evident that the sources used by the writer included some of the canonical books, principally the books of Samuel and Kings, with the Pentateuch and Joshua employed less extensively. The material from these canonical books is largely in the form of verbatim extracts, with omissions and additions, but not rewritten. The author also refers to other sources under at least 15 titles, such as: The Book of the Kings of Judah and Israel, II Chron. 16:11; The Book of the Kings of Israel and Judah, II Chron. 27:7; The Midrash of the Book of the Kings, II Chron. 24:27. It is obvious that several of the titles refer to the same work, and that is possibly the case with all. The principal source

used by the writer, then, aside from the canonical books, is a work covering the history of Israel and Judah; whether any other sources are referred to is uncertain. It is probable that the material from the extra-canonical source or sources is rewritten. At any rate, the portions not drawn from the canonical books all have the same peculiar late style.

The historical value of the portions of Chronicles not derived from the canonical books is uncertain. Much of the material is distinctly improbable, some being quite out of harmony with the earlier material from the canonical books. On the other hand, it cannot be asserted that there is no historical element in this added material. The evidence is not sufficient to afford a positive judgment in every case. The religious standpoint of the book is that of the time of the writer, and he puts that standpoint into the earlier time. The historical value of the book is largely that of showing the religious standpoint of about 300 B.C.

CHRONICLES OF CLOVERNOOK, a story by Douglas Jerrold, published in 1846. Clovernook is a "hamlet wherein fancy has loitered away a truant hour"; and under the guidance of the "Hermit of Bellyfulle" the author explores Clovernook, and discourses of it. The book charms by its quiet humor, the grace of its fancy and the benevolence which characterizes even its satire.

CHRONICLES OF FROISSART. See CHRONICLE.

CHRONICLES OF THE CANONGATE, a collection of Sir Walter Scott's stories published in two series. The first series (1827) contains *The Highland Widow*, *Two Drovers*, and *The Surgeon's Daughter*; the second series (1828) contains *The Fair Maid of Perth*.

CHRONICLES OF THE SCHONBERG-COTTA, shen'berg-kót'tä, **FAMILY**, a novel by Mrs. Elizabeth Charles, published in 1863. It is the story of a family during the period of the Reformation in Germany, as told chiefly by Friedrich and Else, the oldest children. The book is written with an effort after the archaic style, and has much of the simplicity and directness of the old chronicles. It is interesting and has proved a great favorite, though accurate scholarship finds fault with its history.

CHRONOGRAM, a device by which a date is given in Roman numerals by printing certain letters of an inscription larger than the others; as in a motto of a medal struck by Gustavus Adolphus in 1632: ChristVs: DVX; ergo

trIVMphVs. The value of C and the other capitals equals 1632, MDCXVVVII.

CHRONOGRAPH, a device for obtaining a permanent record of the time of an event. The existence of this record distinguishes the chronograph from other devices—such as the stop watch—that are used for determining the times of events. Moreover, the times determined by the chronograph are referred to a clock, and have a certain absolute significance depending on how well the correction to the reference clock is known on an accepted standard of time. This feature distinguishes the chronograph from the chronoscope which is used when it is a question of measuring small intervals of time.

Generally the chronograph itself is not a clock, but only serves as an intermediary between some standard of time and the event to be timed. The development of the crystal-controlled oscillator as a source of constant frequency to run a small synchronous motor has led, however, to a type of chronograph that may itself serve as a clock. This results in a more direct determination of the time of an event and eliminates such error as may arise from the non-linearity of the time scale provided by the chronograph acting as an intermediary. However the use of the chronograph as a clock is dependent on the availability of a source of constant frequency, so that the older types such as the writing chronograph are still much used.

The simplest form of writing chronograph is the drum chronograph. In this device a record is made on a sheet of paper fastened around a cylindrical drum. A weight driven clockwork rotates the drum about its axis, which is horizontal. The rate of rotation is controlled by a governor, which is adjusted to cause the drum to rotate once every minute or half minute. A small carriage carrying an electromagnet and pen holder, forming part of the armature, is driven along ways parallel to the drum by a screw; each rotation of the drum moves the carriage forward about one twelfth of an inch, the pen thus describing a spiral on the drum. The electromagnet is connected in a circuit with the standard clock so that every second, or every other second, the circuit is closed momentarily through a contact in the clock. Thus the electromagnet pulls the armature to it in opposition to a small spring, the pen making a jog in the line it is tracing on the paper wrapped around the drum. If the event to be timed is made to similarly produce a record, the time of its occurrence may be estimated by interpolating the time of the jog made by the event among the jogs made by the standard clock. A scale with the length of the interval between successive seconds, as indicated by the standard clock, as a unit facilitates the interpolation. By having the standard clock omit the recording of a particular second of each minute and observing the time of starting the chronograph, the signals recorded by the clock may be identified. If a sufficiently accurate source of alternating current is available, a synchronous motor may be substituted for the weight driven clockwork, resulting in greater uniformity of rotation.

Another form of the writing chronograph records on a tape. In this type a ribbon of paper is pulled uniformly past the pen, which is stationary. The jogs are recorded as before and the time of any jog is read with a scale. This type

of chronograph permits a small section of record to be examined without the necessity of stopping the chronograph and removing the entire record as with the drum chronograph. Either of these chronographs permit the time of an event to be estimated with an accuracy of one one-hundredth of a second.

A form of chronograph invented by George Washington Hough prints the time of an event directly to the hundredths of a second. A paper tape is drawn past three printing wheels having engraved on their peripheries numbers corresponding to minutes, seconds and hundredths of a second, respectively. The tape is passed between these wheels and a set of hammers attached to the armature of an electromagnet. Whenever the circuit through the electromagnet is completed, the hammers press the tape momentarily against the wheels and the time is printed on the tape, which is then pulled forward to leave space for the next printing. The accuracy of this chronograph is dependent on its regulation by the standard clock. The wheel marking hundredths of a second is not fastened directly to the clockwork of the chronograph, but is constrained to move with the clockwork by a pawl rigidly attached to the shaft on which the hundredths wheel is mounted and engaging one of a hundred teeth on a wheel turned by the clockwork. At each rotation this pawl passes under an electromagnet that may be energized by the standard clock, except for an instant at the beginning of each second. Hence if the pawl arrives under the electromagnet before the beginning of any second, it will be disengaged from the toothed wheel and the printing wheel held up until the pawl is released at the start of the next second. If the governor on the chronograph is set so that the toothed wheel is driven slightly fast, this regulating action will take place each second that the electromagnet is energized. In practice the electromagnet is energized every fourth second and the governor is carefully adjusted so that the corrections do not exceed one or two hundredths of a second. The wheel for printing seconds is caused by a pawl to advance one unit with each revolution of the hundredths wheel. The minutes wheel is similarly advanced one unit with each revolution of the seconds wheel. By causing the standard clock to print a record, the chronograph may be set at the beginning of a run so that the time printed will be that indicated by the standard clock.

A form of printing chronograph designed and constructed at the United States Naval Observatory permits the simultaneous intercomparison of eight independent series of signals. In this chronograph a paper tape is fed between a set of eight rollers and printing wheels opposing the rollers. The printing wheels are mounted end to end along the same shaft and spaced about one quarter inch apart. Each wheel is three quarters of an inch long and the same in diameter; a series of 20 raised dashes forms a spiral around each printing wheel, each dash is about one twelfth of an inch long. These wheels are rotated 10 times a second by a constant speed motor operating off commercial current. The paper is fed past the wheels at a rate that moves it forward a little more than the length of a dash in a tenth of a second thus the wheels print 10 columns of dashes on the paper each second, each dash representing 0.005 seconds. In practice the rollers opposing the printing wheels

are held at a distance of about 0.01 of an inch by small electromagnets acting against springs, so that an impression is made on the paper tape only during the time that the circuit through the electromagnet is open. Since the circuit to each electromagnet is held open for only a few tenths of a second, each second by a clock, the record for each clock will be a series of impressions; each impression consisting of two or three columns of dashes. If two clocks are in agreement corresponding impressions will start with the same dash. If one clock lags behind the other the difference in time is the difference in dashes multiplied by 0.005 seconds. By reading a number of impressions, two clocks may be compared with an accuracy of about 0.002 seconds. Provision is made to have one clock operate all the magnets simultaneously, so that they may be adjusted to start an impression with the

an image of one or two numbers on the disc. At the same time four scales divided into seconds and tenths, are projected on the film by another lens (6) from a rotating drum (5). By this means, current interruption occurring in four different circuits may be timed simultaneously. These interruptions are indicated by lines appearing alongside the time scales, and the times of the beginnings of these interruptions are read to the nearest tenth of a second by the scales, while the hundredths and thousandths of the second are indicated by the figures. Since the strobotron flashes endure for less than a ten-thousandth of a second, the numbers are photographed without blurring.

A spark chronograph developed at the Loomis Laboratories, Tuxedo Park, N.Y., affords a means of intercomparing continuously the rates of two or more clocks. As originally constructed

Photographic chronograph constructed and used at the United States Naval Observatory.

same dash when actuated at the same time. The dashes are arranged on the printing wheel so that a printed column of 20 is broken into groups of four to permit easy identification of corresponding dashes and counting.

A photographic chronograph constructed* at the United States Naval Observatory is driven by a thousand cycle subsynchronous motor (1 in illustration) which is controlled by a quartz crystal oscillator, insuring high accuracy. The rotor of the motor carries four discs (2), each graduated from 00 to 99. Since the rate of rotation is ten revolutions per second, the figures correspond to thousandths of seconds. Four strobotron lamps are provided, one to illuminate each scale. A system of shields, not shown in the drawing, prevents each lamp from illuminating more than one of the discs. When any lamp flashes a lens (3) projects on to 35 mm. film (4)

the record is made on a prepared paper tape run between a comb of one hundred equally spaced phonograph needles and a grounded metal bar. Each of the one hundred needles in the comb has its counterpart in a circle of one hundred needles surrounding a rotating disc carrying a single needle. This disc is caused to rotate 10 times a second by a synchronous motor operated by a crystal-controlled oscillator. The ticks from a clock to be compared with this standard actuate a relay and complete a circuit between the rotating needle and that one of the set of one hundred surrounding the distributor that is nearest it at the time of the tick. This needle is charged to a high potential, causing a spark to pass from the corresponding needle in the comb to the metal ground beneath the paper, the spark producing a small hole in the paper. If the second clock has the same rate as the standard, it will always

charge the same needle in the comb and a row of holes will be formed parallel to the edge of the paper. If the rate differs, progressively different needles will be charged and the row of holes will have a slope relative to the edge of the paper, the amount of the slope being a measure of the relative rates of the clocks. If several clocks are compared simultaneously the relative rate of any two is measured by the angle between the lines formed by each. A difference in rate of 0.001 seconds a day between two clocks is easily detected by this device.

HARRY M. BENDLER,
United States Naval Observatory.

CHRONOLOGY, the science of dating which arranges time into periods or divisions and attempts to assign precise dates to events within those periods. Exactness in history depends upon exactness in chronology. Events of one nation cannot be correctly integrated with those of another until a correct chronology has been established for both. The attainment of absolute correctness is the goal of those who would make history an exact science and the goal is nowhere in sight at present. New evidence is constantly being introduced and revisions are made accordingly; the chronologies of one generation are likely to be unacceptable to the next. Advances made in our knowledge in a little over a century are breathtaking when one considers that at the beginning of the reign of Queen Victoria, Archbishop Ussher's date of 4004 B.C. for the creation of the world was still accepted. This article can do no better than serve the reader as a guide to latest authoritative findings.

First awareness of recurrent phenomena marking divisions of time came from simple observations of nature. Earliest divisions of the year were probably not according to four seasons, but to two—heat and cold. The year began with the awakening of spring and closed with the onset of winter. The winter months were a wretched hiatus in the year's round of the primitive farmer.

Division of the year into four seasons is based upon observations of positions of stars or constellations. One of the oldest of existing farmers' calendars, Hesiod's *Works and Days*, prescribes plowing and sowing operations according to the rising and setting of constellations. Aside from the need for observing the proper time for agricultural operations, religion required the close observation of recurring celestial phenomena. Failure to observe the right day for a ceremony would result in the displeasure of the gods. So formal reckoning of time and the development of calendars came into the hands of the priest class. Calendars all over the world began as cycles of religious feasts. Feast and fast days observed in religious calendars today are a surviving feature from earliest calendars.

These are matters of prehistory that more properly belong in the scope of the archaeologist and anthropologist. When we come to historical times we are surprised to find how difficult it is to establish chronologies in the early period, even in countries like Egypt and Babylonia, where abundant records have survived and where careful observations of celestial phenomena were made.

Egyptian Chronology.—Most dates are approximate, and before 2000 B.C. are given in round numbers. In the early period Egyptians

dated by outstanding events associated with the reign of a pharaoh, such as "the year of smiting the northerners"; later they used the more precise system of reckoning according to regnal years, such as "the twelfth year of Senwosret III." In the absence of complete king-lists it is impossible to establish an exact chronology. Partial lists have been found: the *Turin Papyrus* (c.1200 B.C.); the *Palermo Stone* (c.2600 B.C.); the Royal Lists of Abydos, Karnak, and Sak-kara; and the *Aegyptiaca* of Manetho. Manetho was an Egyptian high priest who about 280 B.C. wrote a history of Egypt in Greek from earliest times to 323 B.C. He had access to complete king-lists and detailed records, but unfortunately his work is fragmentary. He set up a system of arranging all Egyptian rulers, from the first historical king Menes to Alexander the Great, into 30 dynasties, with larger divisions of Old, Middle, and New Kingdoms. This system is still in use today.

Other bases for Egyptian chronology are records of synchronous events and astronomical observations. The Amarna Letters (q.v.) and the Boğazköy records have provided numerous synchronisms between kings of Egypt and Babylonian, Assyrian, and Hittite chronologies. Egyptians, from very early times, celebrated the heliacal rising of Sirius with a feast, because this was the harbinger of the annual flooding of the Nile. Upon this event they established their calendar of 365 days, divided into 12 months of 30 days each, with 5 feast days at the end of the year. Every 4 years the calendar was 1 day short and every 1460 years it righted itself. Such a period was called a Sothis-period from their name for Sirius. This discrepancy was known to them, and in 238 B.C. a reform was proposed in the Decree of Canopus by which a day was to be inserted every fourth year. This proposal was to become the basis for the reformed Julian Calendar of Julius Caesar. One cycle is supposed by some to have ended in 139 or 143 B.C., and by calculating from the beginning of this Sothis-period the accession of Amenhotep I would be dated at 1553 or 1557 B.C.

The Borchardt-Edgerton chronology (1935-1937) given here differs little from those of Breasted and Eduard Meyer, who place the Old Kingdom slightly earlier. The chronology of Flinders Petrie is no longer widely accepted.

PREDYNASTIC PERIOD: Before 320' B.C.

PROTODYNASTIC PERIOD: 3200-2800 B.C. Dynasties I-II. OLD KINGDOM: 2800-2250 B.C. Pyramid Age. Dynasties III-VI.

FIRST INTERMEDIATE PERIOD: 2250-2000 B.C. Collapse of Old Kingdom. Dynasties VII-XI.

MIDDLE KINGDOM: 2000-1780 B.C. Dynasty XII.

SECOND INTERMEDIATE PERIOD: 1780-1546 B.C. Dynasties XIII-XVII.

NEW KINGDOM: 1546-1085 B.C. Dynasties XVIII-XX.

THE DECLINE: 1085-332 B.C. Dynasties XXI-XXX, ending with conquest of Egypt by Alexander the Great.

Early Babylonian.—Chronology of Sumerian and Akkadian dynasties is usually based upon estimated dates of Hammurabi's reign. Around this time greater reliance can be placed upon synchronisms and records of astronomical observations. By working backwards through existing king-lists it is possible to set up a system of earlier Babylonian dynasties whose dating is at best roughly approximate.

The early Kish and Uruk dynasties of the king-lists are now referred to the first half of the third millennium B.C., a period called *Early Dynastic*. The king-lists become more reliable

when we reach the *1st Dynasty of Ur*, beginning with the reign of Mes-anne-pada (c.2525 B.C.). This is the dynasty of the Royal Tombs of Ur and is said to have lasted 177 years. It ruled over most of Babylonia. The next ruler to enjoy wide hegemony was Lugal-zaggisi (c.2289-2264). He was defeated by Sargon I, an Akkadian, about 2264. Sargon ruled at Agade (c.2277-2221). His grandson, Naram-sin (c.2197-2160), attained to still greater glory and domain. An invasion of a barbarian horde of Gutis followed a brief period of anarchy and, after about 90 years, the Gutis were driven from Babylonia by the king of Uruk (c.2060). Then came the *3d Dynasty of Ur* (c.2053-1944), under which Sumerian culture reached its highest development. After a period of rival dynasties of mixed rulers at Isin and Larsa, the *1st Dynasty of Babylon* was established, whose sixth king, Hammurabi (c.1728-1686), brought the early Babylonian empire to its greatest glory. It soon crumbled before a Kassite subjugation (c. 1677) which was to last intermittently for over five centuries.

Minoan Chronology.—Sir Arthur Evans set up the system which has long been standard for Aegean chronology by basing his scheme upon synchronisms with Egypt according to the Egyptian dating in Eduard Meyer's *Aegyptische Chronologie*. It now appears that Evans' estimate of 1300 years of early bronze age culture in his Early Minoan I-III period was too great. A revised chronology incorporating an average between two recent archaeological estimates of Early Minoan dating follows:

Early Minoan I	2000-2600 B.C.
Early Minoan II	2600-2350
Early Minoan III	2350-2100
Middle Minoan I	2100-1900
Middle Minoan II	1900-1700
Middle Minoan III	1700-1550
Late Minoan I	1550-1450
Late Minoan II	1450-1375
Late Minoan III	1375-1100

Assyrian Chronology.—This is founded upon abundant sources of information which are for the most part corroborative. As a result the period from 911 to 626 B.C. is established with possible discrepancies amounting to one year in some reigns. From 911 to 1068 B.C. the margin of error may be as much as ten years, and beyond the latter date the possibility of error increases. Among the important sources are the so-called *limnu* lists for the years 890-648 B.C., which are tables of archons whose years of office were designated by their names. Lists of Assyrian kings covering the period from the 24th century to 746 B.C. were found in the palace of Sargon II at Khorsabad. The *Synchronous History* records relations between Assyria and Babylonia for eight centuries preceding 800 B.C. The *Gadd Chronicle* gives a good account of the closing years of the Assyrian Empire and the rise of the Late Babylonian Empire. The *Canon of Ptolemy* is a list of Babylonian and Persian kings, with the length of their reigns, from Nabonassar (747 B.C.) to Alexander the Great. The *Era of Nabonassar* begins in 747 because in February of that year the Babylonians instituted an astronomical calendar, consisting of a 19-year cycle with 7 intercalated months within the cycle, which closely approximates a true astronomical calendar. The Greek astronomer Ptolemy used this calendar as the basis for his canon. Dates of some important Assyrian kings, according to Olmstead, are:

Tiglath Pileser I	1115-1102 B.C.
Ashur-nasir-apal II	885-860
Tiglath Pileser III	746-728
Sennacherib	705-681
Ashur-bani-apal	669-626

Hebrew Chronology.—It is probably true that the chronology of no other people has received a greater amount of scholarly attention than that of the Hebrews. Furthermore it is customary practice to base biblical chronology upon the fairly well-established chronology of the Assyrians. In the accounts of the reigns of the kings of Israel and Judah the duration of each reign is recorded with cross references telling in what year of the reign of a king of Judah a king of Israel came to the throne, and vice versa. In spite of all these facts biblical chronology has remained a perplexing tangle of seemingly insoluble problems.

To begin with, the recorded years of the reigns of the kings of Judah to the fall of Samaria amount to 31 more than the years of the kings of Israel over the same period, and no cross references after the first two reigns are correct. The years from the First Temple to the Second number exactly 480. The years of the kings of Israel number 240. The period from Abraham's departure from Ur to the Exodus was 480 years and from the Exodus to the First Temple was 480 years. It is evident that the Hebrew chroniclers were seeking symmetry and not accuracy.

It is now believed that the reigns of the monarchy period were stretched to make them conform to the 480-year span, that the period of the exile of the Hebrews in Egypt was extended to make it coincide with the Hyksos invasions, and that the Greek translators of the Septuagint, when they learned from Manetho's recently published (c.280 B.C.) *Aegyptiaca* of the early date of the first Egyptian king Menes, lengthened the lives of the patriarchs to make Hebrew history antedate the Egyptians. Using a synchronism to fix 853 as the last year of Ahab's reign, Edwin R. Thiele has worked out a very precise chronology for the kings of Judah and Israel in *The Mysterious Numbers of the Hebrew Kings* (Chicago 1951).

Late Babylonian-Early Persian (Achaemenid) Chronology, in contrast to other early chronologies, can be presented with assurance of a high degree of correctness. Nearly a century has passed since George Rawlinson published his first edition of *Five Great Monarchies of the Ancient Eastern World* (1862-1867). Of these the first four are hopelessly out of date, but his Fifth Monarchy, the Achaemenid Empire, is still a standard work on the subject. The reason is that Rawlinson possessed virtually all the important sources available to us.

Tables for translating dates from the Babylonian-Persian calendar to the Julian Calendar for the period 626 B.C. to 45 A.D. have been prepared by Parker and Dubberstein which, according to the authors, are astronomically correct to the day in 70 per cent of the cases and may be off by one day in the remaining 30 per cent.

Hindu Chronology.—The Hindu civil year is based upon a sidereal solar year which does not take into account the precession of the equinoxes. Hence there is a slight discrepancy between their year and a true astronomical tropical year. Moreover, the Hindus are divided in their allegiance to 3 different figures for a solar year: 365 days, 6 hrs., 12½ min., according to the

astronomer Aryabhata; 365 days, 6 hrs., 12 min., 30.915 sec., according to the *Rajamriga ka*; 365 days, 6 hrs., 12 min., 36.56 sec., according to the *Surya-Siddhanta*. Aryabhata's year exceeds the Julian year by 5 days in 576 years. His civil year begins as the sun enters Mesha (Aries). In A.D. 603 that was on March 20; now, because of precession, it is occurring in April.

Of the many eras observed in different parts of India the most important are six. (1) The *Kaliyuga Era*, an astronomical system which is still referred to but is not now used for civil purposes. It appears to have been adopted in the 4th century A.D., but its epoch is reckoned from Feb. 18, 3102 B.C. The year 1953 A.D. marked the 5,055th year of the era. (2) The *Vikrama Samvat Era* of northern India began on February 23, 57 B.C. 1953 marked the 2,010th year of the Vikrama Era. (3) The *Saka Era* of southern India, with its epoch of March 3, A.D. 78, is in general use in many parts of India. 1953 was the 1,875th year of the Saka Era. (4) The *Saptarshi Era*, used in Kashmir and some of the Hill states, dates from the moment when the Saptarshi were taken into heaven and became stars of the Great Bear in 3076 B.C. (5) The Buddhists reckoned from the reputed date of the death of Buddha in 543 although he actually died in 483 B.C. This era is still used in Ceylon, Burma, and Siam. (6) The epoch of the Jains was the death of Vardhama, the founder of their faith, in 527 B.C.

Chinese Chronology.—Sometime before 2000 B.C. the Chinese adopted a lunar calendar for their civil year and, by intercalating months, adjusted the lunar calendar to an astronomical year, which they recognized as being $365\frac{1}{4}$ days in duration and in which they intercalated a day every 4 years. Since 206 B.C. the civil year began with the first day of that lunation during which the sun entered the Chinese sign for Pisces. At the same time the Chinese adopted a 19-year cycle, with 12 common years of 12 lunations each and 7 intercalary years with 13 lunations. The months were of 29 or 30 days' duration, but it is not known how these were distributed.

The astronomical year was divided into 12 equal parts, each *tsee* being 30 days, $10\frac{1}{2}$ hours in length. Lunar months were designated by *tsee* names, and in years with 13 lunations, the intercalary month kept the name of the preceding month. Thus the Chinese were able to devise a system of reckoning by cycles of 60. Each of the days in the cycle had a particular name and a date could be noted by the name of the day, month, and year. This practice is helpful to students in verifying Chinese chronology. The Chinese reckon the first year of the first cycle as the 81st year of Emperor Yao's life (2277 B.C.)

Since 163 B.C. records have been kept according to Nien-hao. These were periods of regnal years, each emperor decreeing that the years were to be known as the first, second, third, and so on, of his reign or of some other name. To convert a Chinese date into one in a Western era, it is necessary to refer to a table of Nien-hao. W. F. Meyers, *The Chinese Reader's Manual* (Shanghai and London 1924), offers handy conversion tables of Nien-hao.

When the Chinese Republic was established in 1911, our Gregorian Calendar was adopted. Until 1930 the old and new systems were used side by side, but since then publication and use of the old lunar calendar have been prohibited. Even

so, it is still in use to some extent in China, and is used in Tibet. An official calendar corresponding to our Western calendar is published each year by the Academia Sinica at Nanking.

Japanese Chronology.—There are various ways of reckoning eras among the Japanese.

(1) By a continuous era beginning with the first year of the reign of Jimmu-tenno (660 B.C.).

(2) By reigns of emperors, beginning with the first civil year of the new emperor. At the death or abdication of an emperor the current year was usually counted in his reign, and the reign of his successor began the following year. On rare occasions when the official enthronement of an emperor was delayed for some years after his actual accession, his reign was reckoned from the official enthronement.

(3) By periods, called Nengo. In A.D. 645 the Japanese adopted this system from the Chinese of counting by periods of no fixed length, each with a distinctive name. The first period was called Taikwa, and the system has been in use with a few intermissions ever since. In 1872 it was decided that each emperor's reign should henceforth have only one Nengo.

(4) According to sexagenary cycles, also borrowed from the Chinese. These 60-year cycles of five 12-year periods began in A.D. 424.

The Japanese calendar is Gregorian, in all respects like our Western calendar.

Accurate tables of the various Japanese reckonings are easily accessible. E. W. Clement has prepared conversion tables of Japanese, Chinese, and Korean eras in the *Transact. Asiat. Soc. of Japan*, v. 37, pt. 2 (1910), pp. 133-303.

Greek Chronology.—Although each city-state in Greece had its own calendar, with its own names for the months and its own time for beginning the calendar year, the structure of all their calendars was the same. They were lunisolar, with the year divided into 12 months, alternating in length between 29 and 30 days, the lunar year being $11\frac{1}{4}$ days shorter than the solar year. In order to reconcile lunar and solar years the Greeks adopted at some unknown date (in Central Greece perhaps as early as the Mycenaean Age) an 8-year cycle, with 3 intercalated months during each cycle (*oktacteris*). During the 4th century B.C. a more precise scheme, taken from the Babylonians by Meton, was introduced into Athens. This was the 19-year (Metonic) cycle of years of 12 lunar months, with an intercalated month in the 3rd, 5th, 8th, 11th, 13th, 16th, and 19th years. In the cycle 110 months were "hollow" (29 days) and 125 were "full" (30 days). This makes the average duration of a year $365\frac{25}{100}$ days.

During most of the ancient period the Greeks did not observe an era but designated each year by a local magistrate in office at the time: at Athens the first archon, at Sparta the first ephor, at Argos by the priestess of Hera, a lifetime office. The names of ephors are recorded from 757/756 B.C. and of archons from 683/682 B.C. For Athenian archon-lists see the publications of W. B. Dinsmoor. Dating by local officials is confusing and makes chronology almost impossible. The ancient Greek historians recognized this handicap and during the 4th century B.C. a system of dating from the traditional date of the first Olympiad (776 B.C.) began to be adopted. An Olympiad began with the quadrennial celebration of the Olympic Games, held on the first new moon after the summer solstice.

To convert Olympiads into modern dating multiply the number of Olympiads by 4; if this can be subtracted from 780, the remainder gives the year B.C. when the first year of the given Olympiad begins; for the second, third, or fourth years of the Olympiad, 1, 2, or 3 must be added before the subtraction is made. Thus the third year of Olympiad 75 is 477 B.C. (780-303). For a date in the Christian Era 779 should be subtracted from 4 times the number of the Olympiad. Thus Olympiad 293 begins in the middle of A.D. 393 (1172-779). Since the Olympiads began about July 1, we use double years to express entire Olympic years in modern dates. If an event in Greek history is known to have occurred in the first or last half of our calendar year, the customary double year used by historians is unnecessary.

Roman Chronology.—All European countries have borrowed their civil calendars from the Romans. Tradition reports that the second Roman king, Numa, added two months, January and February, to the earliest Roman calendar, bringing the number of months to 12 and the days of the year to 355, and to overcome the discrepancy of $10\frac{1}{4}$ days between the lunar and solar year, he ordered that an intercalary month of 22 or 23 days (alternately) be inserted every second year between the 23rd and 24th of February. A 4-year period thus contained 1,465 days and the mean length of the year was $366\frac{1}{4}$ days. Another correction was introduced at an unknown date according to which every third period of eight years, instead of containing four intercalary months totaling 90 days, should contain only three months, consisting of 22 days each. This Roman luni-solar calendar now had a mean year of $365\frac{1}{4}$ days. Nevertheless the Roman calendar was permitted to stray far from the astronomical year. This was the fault of the priests, who had the power to intercalate months and who abused this power for political reasons. Cicero, suffering the anguish of a political exile while serving as governor of Cilicia in 51 B.C., wrote his friend Atticus to use his influence to prevent an intercalary month, which would extend his tenure, from being inserted at that time.

Caesar put an end to the confusion when, as dictator, in 46 B.C. he decreed that the civil year be regulated entirely by the sun. Assisted by Sosigenes, he fixed the mean length of the year at $365\frac{1}{4}$ days, and arranged that every 4th year should have 366 days. The year 46 B.C., instead of having 355 days, had 445 days to reconcile it with the astronomical year. Caesar arranged that the months should have 30 and 31 days alternately, with 29 (or 30) for February, but his successor, Augustus, to gratify his vanity, named the 8th month after himself, took a day from February and added it to his own month, and revised the number of days in September, October, and November to give us the year calendar which we use today. The first Julian year began Jan. 1, 46 B.C. The astronomical year is not exactly $365\frac{1}{4}$ days and in 1582 Pope Gregory XIII took steps to make the calendar year coincide with the astronomical year. The Gregorian Calendar was not adopted by Great Britain and the English North American colonies until 1752, and the Julian Calendar is still used by adherents of the Greek Orthodox Church.

The Romans in Republican times designated the years by the names of the consuls of the year. This awkward system was an annoyance

to historians who sought to establish a chronological epoch. Different dates for the foundation of Rome were set by Fabius Pictor, Polybius, Cato, Verrius Flaccus, and Varro. A knowledge of these dates is necessary in order to reconcile Roman historians with each other and with modern dating. Livy, for instance, at times uses the epoch of Cato and at other times that of Fabius Pictor. Modern chronologists adopt Varro's date for the founding of Rome (Apr. 21, 753 B.C.). Since the year 753 A.U.C. ("from the founding of the city") is the year 1 B.C. and 754 A.U.C. is A.D. 1, in order to convert a date A.U.C. into modern reckoning, we must, if it is smaller than 753, subtract its number from 754, for a B.C. date, or, if larger than 753, we must subtract from it the number 753, for an A.D. date.

Mohammedan Chronology.—The Moslem era is reckoned from July 16, A.D. 622, the day following the first day of the month preceding the flight (*Hejira*) of Mohammed from Mecca to Medina. Hejira years are used in Arabia, Egypt, Turkey, Persia, and in parts of India and Malaya. The system was adopted close to the time of the Hejira. The Mohammedan calendar is a lunar one: the years consist of 12 months, each containing 29 or 30 days arranged alternately; an intercalated day comes at the end of the 12th month in appointed years in each cycle of 30 years. The purpose of the intercalated day is to reconcile the first day of the month with the day of the new moon. In each cycle of 30 years, 19 are common and contain 354 days and 11 are *kabishah* and contain 355 days.

To ascertain whether a Hejira year is common or *kabishah*, divide it by 30. The quotient gives the number of completed cycles and the remainder indicates the place of the year in the cycle in question. If the remainder is 2, 5, 7, 10, 13, 16, 18, 21, 24, 26, or 29, the year is *kabishah* and consists of 355 days.

The year 1953, Gregorian Calendar, as recorded in Hejira years 1372-1373 follows:

Jomada I (30)	H.Y. 1372	began on Jan. 17, 1953
Jomada II (29)		began on Feb. 16
Rajab (30)		began on Mar. 17
Shaaban (29)		began on Apr. 16
Ramadan (30)		began on May 15
Shawwal (29)		began on June 14
Dulkaada (30)		began on July 13
Dulheggia (29 or 30)		began on Aug. 12
Muharram (30)	H.Y. 1373	began on Sept. 10
Saphar (29)		began on Oct. 10
Rabia I (30)		began on Nov. 8
Rabia II (29)		began on Dec. 8

Reliable conversion tables of Mohammedan dates are easily obtained. See *Bibliography*.

Medieval Chronology.—A man who traveled in the Middle Ages must have been confused by the numerous systems of reckoning time that varied from town to town and country to country.

Under the Roman Empire years were indicated by the names of the consuls; in the West no consuls were appointed after A.D. 534 and in the East after 541. Thereafter years were designated *post consulatum Paulini* in the West and *p. c. Basilii* in the East. In 566 the Byzantine Emperor Justin II assumed the consulship himself and henceforth Imperial years were reckoned from the January 1 following the emperor's accession. Monarchical countries in Europe reckoned by regnal years but the practice differed. The Franks counted regnal years from the king's accession, but Charlemagne dated from his coronation and this practice was usually ob-

served by the French kings. In Germany reckoning for kings was usually from the date of accession, and, if they became emperors, from their coronation, sometimes from both. In England reckoning was from the coronation date until the death of Henry III, since when regnal years have been counted from the accession. The Pontifical Years of the Popes began not with election, but with ordination.

Various Indiction Cycles were employed. The most important were the *Greek* or *Constantinopolitan Indiction*, beginning on Sept. 1; the *Imperial Indiction* or *Indiction of Constantine* (also known as the *Indiction of Bede*), beginning on Sept. 24; and the *Roman* or *Pontifical Indiction*, beginning on Dec. 25, sometimes on Jan. 1.

The most important eras were the *Spanish era*, beginning Jan. 1, 38 B.C., the *era of Diocletian*, beginning Aug. 29, A.D. 284, the *era of the Armenians*, beginning July 9, A.D. 552, and the *Christian era*, which, during the Middle Ages, was a confusing system because the beginning of the year was set at different days in different countries, and some reckoned the beginning of the era during the year before, others during the year after, the birth of Christ. Dionysius Exiguus, the originator of the era, set its commencement on Annunciation Day, Mar. 25, nine months before the traditional date for the birth of Christ. Other days for the beginning of the Christian era were Jan. 1, Mar. 1, Christmas Day, and Easter. Modern scholars have not reached agreement on the actual date of the birth of Christ. Many favor 4 B.C., others 6, 7, 8 B.C., and Olmstead (*Anglican Theolog. Rev.*, 1942, pp. 24-25) would place the date as early as around 20 B.C.

Mayan Chronology.—The ancient Mayas of the Yucatan Peninsula in Central America seem to have been the first people in the world to realize the indispensability of setting a fixed starting point from which to reckon their chronological era. By making observations from their lofty pyramid-temples with a clear sweep of the horizon in all directions, and by carefully marking risings and settings of celestial bodies along the horizon, the Mayas were able to arrive at a figure for the duration of an astronomical year that is actually more accurate than our Gregorian figure:

Astronomical year	365.2422 days
Julian Calendar year	365.2500 days
Gregorian Calendar year	365.2425 days
Mayan Calendar year	365.2420 days

The Mayas were so exact in their time-reckonings that it is possible to date their monuments with respect to each other to the precise day. Difficulties arise when it comes to translating Mayan chronologies into modern chronologies. A number of systems have been developed, each based upon reasonable arguments. The zero date of the Mayan chronological era, "4 Ahau 8 Cumhu," has been set at Feb. 10, 3641 B.C. by Bowditch and Joyce, at Oct. 14, 3373, by Spinden, and at Aug. 13, 3113, by Thompson.

S. G. Morley, in *The Ancient Maya* (Palo Alto and London 1946), divides the history of the Mayas into three major epochs: Pre-Maya (2500 B.C.?–A.D. 317); Old Empire (317–987); New Empire (987–1697). In an appendix in the same book he offers correlation tables of Mayan and Gregorian chronologies. For other chronological systems of the Mayas see the *Bibliography*.

CHRONOMETER, krô-nôm'ê-tēr (Gr. *chronos*, time + *metron*, measure), an instrument for indicating the time of day with high precision. While the term "chronometer" has been applied to several timepieces differing in appearance and construction, accuracy and uniformity of performance are two of the characteristics which distinguish chronometers from other timepieces. This concept is borne out by the fact that the Swiss timepiece industry recognizes at least four styles of chronometers: wrist, pocket, table (*chronomètre de bord*), and marine chronometers. Of these four, only the last named has been generally accepted as a chronometer in the United States. Nevertheless, even the marine chronometer has not been so precisely defined as to exclude the other types, as is shown by the following definition, adopted by a United States government cataloguing agency:

CHRONOMETER—an instrument for precisely measuring time, manufactured to close tolerances to assure the time-keeping qualities of dependability and consistency of rate. These qualities are accurately ascertained by comparison with more exact devices or by astronomical methods so that the accumulated error may be taken into account when determining time. Its usual uses are to indicate Greenwich Mean Time for navigational purposes, and to serve as a reference for less accurate timepieces. It is provided with a winding indicator dial and is mounted in gimbals to maintain the instrument in a level position. It may consist of a spring-driven or other type of movement which is capable of exacting performance without regulation throughout the normal range of room temperatures.

As indicated in this definition, chronometers are usually provided with a wind-indicator hand which shows the condition of wind of the main-spring. Since other timepieces may include this refinement, the presence of this feature cannot be said to be a distinguishing characteristic of a

chronometer, but few timepieces other than chronometers do include an indicator.

In appearance the wrist chronometer resembles a large wrist watch, and the pocket chronometer a pocket watch. The table chronometer often appears similar to a pocket watch, except that it is usually considerably larger, and may be mounted either in a padded case with a window for reading the dial or in gimbals. The marine chronometer is still larger, usually about four inches in diameter; may somewhat resemble an alarm clock; and is almost always mounted in gimbals.

The gimbals consist of a mounting ring with two pairs of pivots at right angles to each other. The chronometer is mounted in the ring and pivots so that it is pendulous, and the dial tends to remain horizontal if the case is tipped, as aboard ship. In this way, performance deviations due to position are eliminated, and chronometers intended for gimbal mounting are rarely tested in any but the dial-up position.

Uses.—Chronometers are employed in determining longitude at sea; as a reference for less precise timepieces, as in watch and clock repair shops; and in scientific work. As electronics has developed, some functions of the chronometer have been supplemented. For example, position at sea is now often determined by loran, but ships still carry chronometers for safety. Both the National Bureau of Standards and the United States Naval Observatory have regular schedules of radio time transmissions, and frequently these signals are used to check chronometers.

Electronic machines have become available to watch and clock makers, but chronometers are still seen in jewelry store windows. Chronometers are still used in scientific work, and often delicate electrical contacts are installed in them to operate an external electrical circuit at precise intervals. This use has made the item name "make-break circuit chronometer" familiar in scientific laboratories.

Accuracy and Performance Requirements.—

The accuracy and uniformity of performance of the four types of chronometers increase in order from the wrist to the marine chronometer. While the standards of testing laboratories vary, the accuracy required of the marine chronometer is uniformly high. Since the United States Navy is probably the largest American user of marine chronometers, the performance requirements of its instruments are a good indication of what can be expected and realized.

The navy does not issue a marine chronometer to one of its vessels if the daily rate of the instrument exceeds 1.55 seconds. (Daily rate is equivalent to the total dial error which the instrument may accumulate in 24 hours by gaining or losing.) Similarly, uniformity of rate is an important requirement, and instruments are rejected if the rate varies more than .50 second from day to day. Both of these figures take temperature into account and are outside limits. It has been established that the large majority of marine chronometers will keep time to 1 second per day or less. This represents an error of 1 part in 86,400, which is roughly equivalent to 12 parts in 1 million, or approximately 0.001 per cent.

Testing and Certification.—The testing of instruments with such small errors requires an even greater accuracy of the standards. Chronometers were formerly tested only at observatories, where they could be compared directly with the

period of rotation of the earth. With the refinements and increased dependability of the quartz piezoelectric oscillator, however, chronometers now are often compared with the oscillators, and the oscillators, in turn, are compared with the rotation of the earth. The National Bureau of Standards maintains a battery of oscillators which are intercompared with each other and frequently compared with time determined by the Naval Observatory. In this way, the resultant errors are so small that received frequency transmissions controlled by the oscillators are accurate within 1 to 3 parts in 10^7 or 10^8 . Since frequency and time are reciprocals, chronometer errors can be determined at any place where the transmissions can be received.

Marine chronometers are usually built to last a lifetime. Thus they are generally tested once after initial assembly and again after each overhaul. The United States Navy's experience indicates that the marine chronometer should receive a complete overhaul, cleaning, relubrication, and test at three-year intervals if high performance standards are to be maintained. This interval is determined largely by deterioration of the lubricants, although worn parts must occasionally be replaced. After the reconditioning operation navy chronometers are subjected to rigorous tests in temperatures of 55°, 72°, and 90°F. The performance characteristics investigated during these tests are amount of daily rate, uniformity of the rate, temperature compensation, recovery from temperature changes, and isochronism.

Chronometers which pass the rate tests are ordinarily certified individually to the final user. The usual certificates consist of a résumé of the test results with dates, and were formerly signed by individuals at the observatories charged with conducting the tests. Out of this custom evolved what was considered a distinguishing characteristic of a chronometer: a performance certificate from an observatory. Like the winding indicator, however, the provision of a certificate can no longer be said to constitute a unique trait, since laboratories may test and certify any timepiece submitted. Individual certificates are seldom justifiable for timepieces other than chronometers.

Construction.—The internal construction of marine chronometers may vary between makes, but there are at least two structural features which rarely appear in other timepieces: the fusee and the detent (detached) escapement.

The fusee is a mechanism designed to transmit constant torque to the train, regardless of the state of wind of the mainspring. In chronometers utilizing the fusee principle, the gear train is driven from a wheel attached to the fusee, rather than from the mainspring barrel, as in ordinary timepieces. The fusee, in turn, is driven from the mainspring barrel by means of a flexible connection, usually a chain, which unwinds from the fusee and winds onto the mainspring barrel as the energy stored in the mainspring is released. The diameter of the mainspring barrel is constant, but the lever arm of the fusee changes continuously as the chain unwinds from it. The changing fusee diameter is designed to compensate for the decrease in mainspring force as the instrument proceeds to run down from the fully wound condition. Thus, in the expression "torque = force \times radius," an effort is made to keep constant the driving torque from the fusee wheel by increasing the acting radius of the fusee as the mainspring force decreases.

The detent escapement is a means for disengaging the balance from the train during as much of its excursion as possible, for in this way its natural period of oscillation can be more nearly approached. Ideally, if the balance and hairspring were without friction, the energy required to sustain its oscillations would be zero, the balance could be entirely detached from any energy-supplying mechanism, and the natural period of oscillation would be realized. Since the energy losses must be supplied, however, the detent escapement is designed to permit sufficient energy to flow into the balance to sustain oscillations but, at the same time, to be engaged with the balance, and thus to interfere with its movement to the minimum extent possible.

In addition to the fusee and detent escapement, the construction of the balance assembly in a chronometer is of interest. All chronometers were formerly equipped with a classical split balance with a bimetallic rim and adjustable compensating weights. During World War II, however, the Hamilton Watch Company built a large quantity of marine chronometers for the United States government, and it was able to eliminate the traditional split balance by using newly developed materials. One of these was Invar, which has an extremely low coefficient of thermal expansion, and this alloy was used for the arm or spoke of the balance. The wheel itself was made of stainless steel, and was not split. This construction provided a more rugged balance, and other advantages also resulted. Most marine chronometers have been made with helical hairsprings, and while the Hamilton instrument retained this feature, improved materials were used in its construction. See also CLOCK.

BYRON B. MIZELL,

Horological Instruments Branch, Navy Department, Bureau of Ships.

CHRONOSCOPE, krōn'ō-skōp, an instrument for measuring time, especially one for measuring intervals of time, rather than time of day. The intervals measured are usually short, and determined with precision. They may be measured by mechanical, electromechanical, or purely electrical methods. The development of the cathode ray tube has enabled chronoscopes to measure intervals of the order of one millionth of a second.

BYRON B. MIZELL.

CHRUDEM, krōō'dyīm, town, Czechoslovakia, situated in Bohemia, on the Chrudimka River, 35 miles north of Brno. Settled prior to the 11th century, it contains a 13th century Gothic church, a 16th century Capuchin abbey, and a baroque town hall. The town serves as a market for a fertile agricultural district producing mainly sugar beets, and it has sugar refineries, distilleries, breweries, and plants manufacturing cotton textiles, cables, rope, and footwear. Pop. (1947) 13,217.

CHRYSAL, OR THE ADVENTURES OF A GUINEA, a satirical novel by Charles Johnstone, published in four volumes in 1760-1765. Chrysal, the spirit inhabiting a guinea, passes through many hands, from a prince's to a beggar's, and tells its own story, which consists

chiefly of the adventures of those in whose possession it is for the time being.

CHRYSALIS, krīs'ā-līs, the pupa (q.v.) of a butterfly. It is the immobile stage through which the caterpillar is transformed into the adult. When the caterpillar is full grown, it spins a small, silken mat, and when the skin is shed, the cremaster, a spine at the tail end of the chrysalis, is thrust into the mat. If the chrysalis hangs head down, no other silk is spun, but in very many species a silken girdle is spun near the middle to hold the chrysalis in a horizontal or upright position. After the chrysalis is formed, the larval structures almost all break down, forming a thick, liquid mass from which the adult structures develop.

Chrysalides are extremely varied in shape and color. Some are plain, oval, and mummylike. Others have elaborately sculptured shapes or spiny or knobby projections. Some are dull, plain green or brown, while others are brilliantly colored, often with gold or silver markings. Each species holds to its own pattern, and most species can be readily identified by the characters displayed. The chrysalides of the genus *Papilio* are held in an oblique or vertical position by the girdle and have a pair of short horns and a stubby beak at the head end. Pierid chrysalides are generally greenish, and are also fastened by a girdle; they are extremely variable in shape. The chrysalides of most other butterflies hang head down. See also BUTTERFLY.

CHARLES H. CURRAN,

Curator, Department of Insects and Spiders, The American Museum of Natural History.

CHRYSANDER, krü-zän'dēr, Friedrich, German music scholar: b. Lüththeen, Mecklenburg-Schwerin, July 8, 1826; d. Bergedorf, Hamburg, Sept. 3, 1901. He studied philosophy at the University of Rostock, but later devoted himself exclusively to music. From 1868 to 1871, and again from 1875 to 1882, he edited the *Allgemeine musikalische Zeitung*, to which he contributed numerous articles, many of them attacking contemporary trends in music. He also edited *Die Jahrbücher für musikalische Wissenschaft* (2 vols., 1863-1867), and, with others, the *Denkmäler der Tonkunst* (5 vols., 1869-1871) and the *Vierteljahrsschrift für Musikwissenschaft* (1885-1895). The work for which he is best known is his monumental 100-volume edition of the works of George Frederick Handel, published from 1859 to 1894 under the auspices of the German Handel Society, which he helped to found in 1856. Chrysander also began a biography of the composer, but completed only two volumes and the first part of a third (1858-1867).

CHRYSANTHEMUM, a genus of 140 species of annual and perennial herbs and small shrubs with daisylike flowering heads belonging to the family Compositae, and related to *Matricaria* and *Tanacetum*. There are two main centers of distribution: one in the Mediterranean region, where the annual species occur; and the other in China and Japan, where the plants are predominantly perennial. In addition, some of the species have spread throughout Europe and Asia, north into Arctic latitudes, and into North America.

One of the important factors in the evolution of *Chrysanthemum* has been polyploidy, which involves hybridization between the species, fol-

lowed by the establishment in the hybrid derivatives of an increased number of chromosome sets. The original diploid species of *Chrysanthemum*, which possess only two chromosome sets and have a total of 18 chromosomes (9 kinds of chromosomes and 2 of each kind), occur mainly in the Mediterranean region. Throughout the rest of Eurasia there are species with 3, 4, 6, and up to 22 chromosome sets, and with chromosome numbers ranging from 27 through 36 and 54 to 198.

Marguerite is a shrubby species (*C. frutescens*) from the Canary Islands which is grown as an ornamental. Shasta daisy is a very floriferous race selected from wild stocks of *C. maximum* in the Pyrenees Mountains. Corn marigold is a Mediterranean species (*C. segetum*). Pyrethrum (q.v.), an insecticide for the control of household pests, is produced from the dried flowers of *C. cinerariaefolium* and *C. coccineum*, which are cultivated for this purpose (see also INSECTICIDE).

The large autumn-flowering garden chrysanthemums are derived from several wild species in China and Japan, particularly *C. indicum*, *C. morifolium*, *C. ornatum*, and *C. makinoi*. The almost infinite diversity of the garden chrysanthemums is the result of centuries of selection and hybridization, first by Chinese and Japanese gardeners (since about 500 B.C.), then by English and European breeders (since 1789), and later by American horticulturists. These numerous horticultural varieties are commonly grouped according to the arrangement of the individual florets composing the head into several main classes: incurved, incurving, reflexed, anemone flowered, single, and pompon. These groupings are further subdivided into indoor and outdoor varieties; and the latter, in turn, into large, medium, and small flowered. Within each division numerous permutations exist with respect to color of the blooms, ranging from white through pink and yellow to bronze and deep blood red (but not blue or purple).

The common garden chrysanthemums are best propagated from cuttings. Root cuttings are taken in winter or early spring, depending on the variety, and are rooted in a rich and well-aerated sandy loam in a greenhouse. After rooting, outdoor chrysanthemums are gradually hardened by removing to a lath house, and are set out in the ground after the last frosts of spring. Some of the choicest exhibition varieties are grown entirely under glass. Annual chrysanthemums are, of course, grown from seeds.

Chrysanthemums are subject to their full share of fungous diseases and attack by gall midges, root maggots, leaf miners, and various other pests. In each case control consists of fumigation with some appropriate fungicide or insecticide.

CHRYSAROBIN, krīs-ā-rō'bin, a mixture of neutral principles obtained from Goa powder,

a substance deposited in the wood of *Andira araroba*, a Brazilian tree. It is brown or orange yellow in color. Chrysarobin is not administered internally, but applied externally as an ointment, and is said to be of benefit in psoriasis, ringworm, and other parasitic skin diseases.

HAROLD WELLINGTON JONES, M.D.

CHRYSEIS, kri-sē'is, in the *Iliad* (q.v.), the daughter of Chryses, a priest of Apollo. She was captured by the Greeks and given to Agamemnon, who refused to accept her father's offer of ransom. At Chryses' prayer, Apollo sent pestilence and death to the Greek camp. Agamemnon found himself obliged to give up Chryseis, but then robbed Achilles of Briseis, thereby precipitating the dissension between the two heroes which long delayed the conquest of Troy.

CHRYSELEPHANTINE, krīs-ēl-ē-fān'tin, in ancient Greek art, pertaining to statues overlaid with ivory and gold. The frame on which the ivory plates were fastened was usually of wood, and the gold was used for the garments and the hair. The most celebrated chryselephantine statues were the colossal works of Phidias, the largest of which was *Athena Parthenos*, a 41-foot statue of the goddess which stood in the Parthenon in Athens.

CHRYSIPPUS, kri-sīp'ūs, Greek Stoic philosopher: b. Soli, Cilicia, c.280 B.C.; d. 207 B.C. He went about 260 B.C. to Athens, where he attended the lectures of Arcesilaus, but subsequently became a disciple of Cleanthes, whom he succeeded, in 232, as the leader of the Stoics. He defended Stoicism vigorously against the Academy, and did much to systematize it. Of the more than 700 works which he is said to have written, only fragments survive.

CHRYSLER'S FIELD, Battle of (known also as **BATTLE OF CHRYSLER'S FARM**), an engagement in the War of 1812, fought on Nov. 11, 1813. Maj. Gen. James Wilkinson, in command of one of two forces sent to attack Montreal, set out from Sackets Harbor, N. Y., on October 17. The expedition was mismanaged from the start. Both Wilkinson and his second in command, Morgan Lewis, were ill, and John P. Boyd, an incompetent general, was virtually in charge. A flotilla of 300 boats, carrying the infantry and artillery, began the descent of the St. Lawrence River on November 5, while a cavalry brigade of 500 men led by Jacob J. Brown marched along the bank. On November 10, the Americans reached the Long Sault and anchored for the night at Chrysler's Field, on the Canadian side of the river about 90 miles from Montreal. On the following morning, just as the flotilla was about to run the rapids, a British force led by Col. J. W. Morrison approached. In the ensuing battle, Boyd committed his force of 2,000 men piecemeal, and it was easily defeated by the British force of 800 regulars, militia, and Indians. The engagement lasted for about two hours, and the Americans then retreated to the boats, and on the following day ran the rapids to Cornwall. There Wilkinson learned that Wade Hampton, in command of the second attacking force, had ended operations for the season after the Battle of Châteauguay (see CHATEAUGUAY, BATTLE OF), and gone into winter quarters on the Salmon River. American casualties in the Battle of Chrysler's Field

totaled 102 killed and 237 wounded; British, 22 killed, and 48 wounded, and 12 missing.

CHRYSOBALANACEAE, krīs-ō-bāl-ā-nā'sē-ē, a plant family closely allied to the Rosaceae or rose family, and comprising 12 genera with 180 species, all trees or shrubs. *Chrysobalanus icaco*, the coco plum, is found on coasts and along streams from southern Florida to South America, and also in Africa. It is sometimes planted in the extreme southern United States as an ornamental shrub for its sweetish, plum-shaped fruits, which are occasionally used in preserves. The seeds contain a considerable amount of oil, and the astringent bark, leaves, and roots have been used in medicine.

Consult Sargent, C. S., *Manual of the Trees of North America*, 2d ed., pp. 583-85 (Boston 1922).

CHRYSOBERYL, krīs'ō-bēr-īl (Gr. *chrysoberyllos*, golden beryl; known also as CYMOPHANE), a native beryllium aluminate, having the formula BeAl_2O_4 or $\text{BeO} \cdot \text{Al}_2\text{O}_3$, and crystallizing in the orthorhombic system. It is transparent to translucent, with a vitreous luster, and is usually yellow or pale green. The variety alexandrite (q.v.) is green by daylight and columbine red by artificial light. The finer varieties are used as gem stones. Chrysoberyl has a hardness of 8.5 and a specific gravity of 3.5 to 3.84. It is found in Maine, Connecticut, New York, and Colorado in the United States, and in Brazil, Ceylon, Ireland, and the USSR. See also CAT'S-EYE; PRECIOUS STONES.

CHRYSOCOLLA, krīs-ō-kōl'ā, a hydrous copper silicate, having the formula $\text{CuSiO}_3 \cdot 2\text{H}_2\text{O}$. It is cryptocrystalline and usually occurs in opal-like or earthy masses, as incrustations, or with botryoidal surface. When pure, it is translucent and sky blue; when impure, it is often opaque and dull green, brown, or black. Chrysocolla has a hardness of 2 to 4 and a specific gravity of 2.40 to 2.42. It is found in copper mines in all parts of the world, and in the United States occurs in Arizona, New Mexico, Utah, and Nevada.

The word means "gold glue," and the chrysocolla of ancient times was apparently a substance used to facilitate soldering.

CHRYSOLITE, krīs'ō-lit (Gr. *chrysolithos*, gold stone), a native magnesium, iron silicate, having the formula $(\text{Mg}, \text{Fe})_3\text{SiO}_4$. It occurs massive and granular, and also in orthorhombic crystals. Chrysolite is transparent to translucent, with a vitreous luster, and is usually olive green or yellow. It has a hardness of 6.5 to 7 and a specific gravity of 3.26 to 3.441. The finest transparent varieties are used as gem stones. Chrysolite is found in New Mexico and Arizona in the United States, and in Brazil and Egypt. Peridot and olivine (qq.v.) are names often used for varieties of chrysolite. See also PRECIOUS STONES — *Peridot*.

CHRYSOLORAS, krīs-ō-lō'rās, Manuel, Greek scholar: b. about 1355; d. April 15, 1415. He was probably a native of Constantinople. In 1393, Emperor Manuel II Palaeologus sent him to Italy to seek assistance against the Turks. Although his mission was unsuccessful, Chrysoloras himself became known for his learning. Returning to Italy about 1395, he became professor of Greek at Florence, where he remained

for three years. There and at Milan, Pavia, Venice, and Rome, where he later taught, he attracted many scholars, among them Leonardo Bruni, Giovanni Francesco Poggio Bracciolini, and Francesco Filelfo. Popes Gregory XII and John XXIII employed him in public affairs, and he went on missions to France, England, Spain, and Germany. He died while on his way to the Council of Constance as the representative of the Greek Church.

Chrysoloras was the first to reintroduce the study of Greek literature in Italy. He translated Homer and Plato's *Republic* into Latin, and he was the author of *Erotemata sive Quaestiones*, the first Greek grammar used in western Europe; and *Epistolae III de Comparatione Veteris et Novae Romae*, a comparison of Rome and Constantinople.

His nephew and companion in Italy, JOHANNES CHRYSOLORAS, was also a Greek scholar.

CHRYSOMELIDAE, krīs-ō-mēl'ī-dē, a family of Coleoptera containing about 25,000 described species. The antennae are of medium length and slightly clubbed, while the tarsi consist of four segments. The family is extremely varied in size and form, but most of the species are minute to small, with relatively few exceeding one half of an inch in length. The flea beetles are all small and slightly elongate, and have their hind legs adapted for leaping. *Coptocycla* and relatives are flattened, and the sides of the elytra and thorax are thin and extend well beyond the body. The gold beetle (*Metritona bicolor*) is able to change color, but is most generally observed in the gold shade. Species of *Pachybrachys* are short and robust, while the leaf-mining forms are flattened and more or less wedge shaped. For the most part, the free-crawling larvae feed on leaves, while some bore into stems and roots.

The family contains a very large number of pests, including such well-known ones as the Colorado potato beetle (*Leptinotarsa decimlineata*), the twelve-spotted cucumber beetle (*Diabrotica duodecimpunctata*), and the striped cucumber beetle (*Diabrotica vittata*). The elm leaf beetle (*Galerucella xanthomelaena*) feeds on elms and skeletonizes the leaves. The dogbane beetle (*Chrysochus auratus*) is brilliant green and is common on dogbanes.

See also LEAF-BEETLE.

CHARLES H. CURRAN,
Curator, Department of Insects and Spiders, The
American Museum of Natural History.

CHRYSOPHYLLUM, krīs-ō-fil'ūm, a genus of tropical American trees of the sapodilla family (Sapotaceae), consisting of about 60 species. They have a milky sap, and alternate leaves with numerous parallel cross veins and golden hairs on the under surface. In the West Indies the fruit of the star apple (*C. cainito*) is considered a delicacy. The fruits are two to four inches in diameter, with a whitish pulp and three to eight seeds.

CHRYSOPRASE, krīs'ō-prāz, a variety of chalcedony (q.v.), colored apple green by nickel oxide and prized, when brilliant, as a semiprecious stone. It occurs in Oregon and California in the United States, as well as in Silesia.

CHRYSOPSIS, krīs-ōp'sis (commonly known as GOLDEN ASTER), a genus of low peren-

nial herbs of the family Compositae, consisting of about 20 species, native to North America. They have alternate leaves and yellow flowers.

CHRYSORRHOAS. See BARADA.

CHRYSTOSTOM, krís'ús-túm, SAINT John, one of the fathers of the Greek Church: b. Antioch, Syria, ?344; d. near Comana, Cappadocia, Sept. 14, 407. Born of a noble and prosperous Christian family, he was brought up in a spirit of ardent piety by his mother, Anthusa, but, according to the custom of the time, was not baptized until he reached full maturity (c.369). In his youth he studied under Libanius, the famous pagan rhetorician, and was one of his favorite pupils. He wanted to dedicate himself completely to the service of the church, however, and in order to be better prepared for this vocation he retired for several years to a monastery and then to a desert. Returning to Antioch in 381, he was ordained deacon and then, in 386, priest. He soon acquired renown as a powerful preacher and an able missionary.

In 398 he was elected archbishop (patriarch) of Constantinople, capital of the Eastern Roman Empire. Here he continued his strict, ascetic life, neglecting the etiquette of the court and the conventions of his position, and used the large revenues of his see chiefly for charitable purposes. He was deeply concerned with contemporary social problems—poverty, inequality, and injustice—and was very critical of the "acquisitive society" of his time: lust for wealth and power was, in his opinion, the major and ultimate reason for all evil and suffering. It was the cause of social disruption and of moral decay. He was critical even of the artistic splendor of the temples. Nothing was said in the Gospel about golden vessels and fine garments, but there was an emphatic commandment of mercy and love: a cup of cold water offered to the needy is of greater value in God's sight than all decorations and adornments. He was suspicious of wealth as such: was it not ultimately rooted in some injustice? He was suspicious even of private property as such: there was no private property at all in the primitive Christian community at Jerusalem. He would apply the strict principle of complete renunciation, as it was practiced in the cenobitic monasteries, to the church at large. He was not a social reformer, however, but an educator of souls. He had in mind conversion, not an abstract plan to be imposed from outside by formal authority.

Chrysostom was one of the most radical and outspoken prophets of social justice, which was the favorite subject of his sermons at Constantinople. Most of his sermons were exegetical. He interpreted the books of the Bible systematically, covering in his addresses the greater part of the New Testament and some books of the Old Testament. Stenographers took down many of his sermons, which have been preserved as they were delivered. He gained great popularity with the people, but his relations with the court were strained, and the strictness of his administration could not make him popular with the clergy and his fellow bishops. Opposition to him was led by Theophilus, archbishop of Alexandria, who had him deposed by a synod of bishops in 403. The decree could not be put into effect because of the vigorous resistance of the people, and although it was not officially revoked, John was

permitted to resume his office. His enemies finally prevailed, however, and in 404 he was banished to Cucusus, an obscure place in the Taurus Mountains. The people of Constantinople rioted in protest, and the great majority of the bishops of both East and West favored John. He was then to be deported to a wilder region, the desert of Pityus, on the northeast coast of the Black Sea, but he died en route, exhausted by the hardships of travel.

In 417 his name was restored in the diptychs of the Church of Constantinople, and in 438 his remains were solemnly transferred to Constantinople and deposited in the Church of the Holy Apostles. His day in the calendar of the Greek Church is November 13; in that of the Roman Catholic Church, January 27. With St. Basil the Great and St. Gregory of Nazianzus, St. John Chrysostom is described in the Eastern Church as a "great ecumenical teacher and hierarch." The feast of the "three hierarchs" is celebrated in the East on January 30; it is one of the major festivals of the Greek Church.

John's literary legacy is very large and consists mainly of sermons and addresses. His eloquence was exemplary, and soon after his death he was named Chrysostom, from the Greek *chrysostomos*, meaning "goldenmouthed." By education he belonged to the school of Antioch, but he lacked a partisan spirit, and in his exegesis combined the main principles of the rival schools of Antioch and Alexandria. He was not a scholar or a creative thinker, but above all a teacher and pastor. His favorite doctrinal topics were the church, the Eucharist, and the priesthood (his remarkable sermons on this subject were widely read for centuries). He was also much concerned with the ordering of worship, and tradition connects his name with the Communion service commonly used in Byzantium and still used throughout the Orthodox Eastern Church, the liturgy of St. John Chrysostom. (The present rite is, of course, an elaboration of the original rite, but all basic points can be substantiated from references in Chrysostom's sermons.)

Bibliography.—WORKS: All of Chrysostom's major works are available in English translation in the *Library of the Fathers* (Oxford 1842-79) and in the *Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, 1st series, vols. 9-14 (Grand Rapids, Mich., 1954), and there are separate editions of his various writings.

BIOGRAPHIES: Stephens, W. R. W., *Saint John Chrysostom, His Life and Times*, 3d ed. (London 1883); Puech, Aimé, *John Chrysostom*, the best biography, tr. from the French by Mildred Partridge, 2d ed. (London 1917); Baur, Chrysostomus, *Der heilige Johannes Chrysostomus und seine Zeit*, 2 vols., the standard work, containing a good bibliography (Munich 1929-30); Newman, J. H., "The Last Years of St. Chrysostom," *Essays and Sketches*, vol. 3, ed. by C. F. Harrold (New York 1948).

GEORGES FLOROVSKY,

Dean, St. Vladimir's Orthodox Theological Seminary, New York.

CHRYSTOTILE. See ASBESTOS.

CHU HSI or **CHU HI**, jōō' shē', Chinese philosopher: b. 1130; d. 1200. As a student of the Chinese classics, he became widely known through his interpretation of the doctrines of Confucius, and was a founder of the Chinese school of speculative philosophy. He had many disciples, and they, under his direction, rewrote a history of China in 59 books. His influence spread to Japan, where, in the 17th century, a school of neo-Confucianism was named Shushi after him.

CHU-KIANG. See PEARL, river.

CHU SHAN, chōō' shān' (Chin. jō' shān'), or **CHUSAN**, archipelago, China, situated in the East China Sea, at the entrance to Hangchow Bay, off the coast of Chekiang Province. It consists of about 100 islands, of which the largest is Chu Shan, 20 miles long by 10 miles wide. On the south coast of this island is the port of Tinghai. Southeast of Chu Shan is the island of Puto Shan, a Buddhist pilgrimage center with a monastery and many temples. Fishing is the chief occupation of the islanders. Pop. about 400,000.

CHUANG-TZU, jōō-äng'dzü', Chinese philosopher and teacher: fl. 4th century B.C. The leading exponent of the teachings of Lao-tzu, he wrote essays which illustrated his ideas with charming allegorical anecdotes. Of his works, 33 chapters have been preserved.

CHUB, a name given to various species of fishes of the family Cyprinidae (q.v.), of which the river chub (*Hybopsis kentuckiensis*) and the creek chub (*Semotilus atromaculatus*) are the most important in the United States. The river chub is abundant in rivers and creeks throughout the eastern United States, and may be known by its orange-colored fins and the tuberculate head of the males in spring. It reaches a length of 10 to 12 inches, and is a favorite with the less ambitious anglers in certain regions. The creek chub, or horned dace, is even more widely distributed, and inhabits brooks rather than rivers. It resembles the roach, but has a black spot in front of the dorsal fin and does not exceed a foot in length.

The large black chub (*Acrocheilus alutaceus*), of the Pacific Coast rivers, is known locally as chiselmouth, squaremouth and hardmouth. The English chub (*Leuciscus cephalus*) is a much larger fish, attaining a length of two feet and a weight of ten pounds, and lives in mountain brooks as well as in rivers. It is a game fish of considerable importance.

CHUB MACKEREL, a fish (*Pneumatophorus grex*), found in immense numbers in the Mediterranean Sea. It is the "Spanish mackerel" of England.

CHUBB, Lewis Warrington, American research engineer and inventor: b. Fort Yates, Dakota Territory, Oct. 22, 1882; d. Wilkinsburg, Pa., April 2, 1952. After his graduation from Ohio State University in 1905, he began work with the Westinghouse Electric and Manufacturing Company and performed valuable research in the development and application of magnetic materials. In 1920, as manager of Westinghouse's newly created radio engineering department, he helped establish at Pittsburgh, radio station KDKA, the first in the United States. From 1930 until his retirement in 1948, he directed the Westinghouse Research Laboratories at East Pittsburgh. During World War II, he figured importantly in government atomic research and planning and conducted an extensive federal study of jet propulsion. At various times he also contributed to the development of refrigeration, radar, measuring devices, the stabilization and control of gunfire, and weapons for anti-submarine warfare.

CHUBB, Thomas, English controversialist: b. East Harnham, Salisbury, Sept. 29, 1679; d. Salisbury, Feb. 8, 1747. He was a mechanic who employed his leisure in the acquisition of knowledge from the best English books which he could procure. In 1715 he published *The Supremacy of the Father Asserted*, the perspicuity and argumentative skill of which obtained for it much notice. Of course a production assailing the orthodox faith did not pass without reply, and a controversial warfare commenced which lasted as long as his life. Between 1725 and 1732 he offered to the world his thoughts on a variety of topics, moral and theological, in 34 tracts, collected in a quarto volume, of which book Pope in a letter to Gay speaks with great respect. Various publications followed: *Discourse Concerning Reason* (1731); *The True Gospel of Jesus Christ Asserted* (1738); and *An Enquiry into the Ground and Foundation of Religion* (1740).

CHUBB CRATER. Discovered in July 1950 by F. W. Chubb, a Canadian prospector who had detected it on aerial photographs, this circular depression is located in a barren, sub-Arctic area of northwestern Quebec, Canada, in the peninsula between Hudson and Ungava bays, and is believed to be the largest meteorite crater known. With a diameter of about 11,000 feet and a maximum depth of 1,325 feet—more than twice the corresponding dimensions of Meteor Crater, Arizona—Chubb Crater contains a lake, the surface of which lies about 500 feet below the top level of the crater's rim. Scientists visiting the site in 1951 discovered evidence of a large "magnetic anomaly" below the eastern rim, and ripples extending outward for two miles in the granite rock which surrounds the crater, indicating its meteoritic origin. Its age was estimated at a few thousand years.

CHUBB LOCK. See Locks.

CHUBUT, chōō-vōōt', territory, Argentina between the Andes and the Atlantic Ocean, in the northern part of Patagonia, so named from a river which drains a large part of the surface. Its area is 86,751 miles. It is a noted lake region, including Puelo, Menéndez, General Paz and Futalaufquén. Its principal interest lies in its Welsh settlement, which has remained almost wholly Welsh-speaking. The first settlers 151, arrived in July 1865. Epochs in its history have been the abandonment of the colony in 1867; the subsequent return from New Bay; a 20 months' nearly complete isolation from the outer world, terminated in 1871. The principal town, Rawson, is situated about five miles from the Atlantic Ocean, and has a population of 2,500. English grain and roots are produced. Coal, gold, salt, and lead are mined. Alfalfa, grain, potatoes, and fruit are grown. Pop. (1942 est.)

CHUCK-WILL'S-WIDOW, a foot-long, nocturnal bird (*Caprimulgus carolinensis*), closely related to the whip-poor-will, to the common nightjar of Europe and many others, and similarly colored in a mottling of black and buff with some chestnut and white. It is common in the southeastern United States north to southern Missouri, southern Indiana and southern New Jersey, wintering from Florida to Colombia. The

name is an attempt to reproduce the song of the bird. Its enormous mouth, two inches wide, beset with long, branched bristles, fits it for catching its food of flying insects and even an occasional little bird. Its two spotted eggs are laid on the bare ground or fallen leaves of woods or thickets.

CHUCKCHEE SEA, chōók'chê (Russ. CHUKOTSKOE MORE), that part of the Arctic Ocean north of Bering Strait bordered by easternmost Siberia (Chukot National District, q.v.) and northern Alaska.

CHUDLEIGH, Elizabeth, COUNTESS OF BRISTOL, English adventuress: b. Chelsea, 1720; d. Paris, Aug. 26, 1788. She was the only child of Col. Thomas Chudleigh, lieutenant governor of Chelsea Hospital. His death in 1726 leaving his widow in poor circumstances, Elizabeth was brought up in the country. Her first serious love affair occurred when she was about 15 and already a noted beauty. Probably through the interest of William Pulteney, afterward earl of Bath, she and her mother returned to London in 1740; in 1743 Pulteney obtained for the young woman the post of maid of honor to Augusta, princess of Wales. The 19-year-old duke of Hamilton fell in love with her, but while he was making the grand tour of the Continent in the summer of 1744, piqued at his seeming neglect (her aunt intercepting the duke's letters), she married a young naval officer, Augustus John Hervey, second son of Lord Hervey and grandson of the 1st earl of Bristol. Since both were poor and she could not afford to give up her court post, the marriage was kept secret even after the birth of a son in the summer of 1747.

Miss Chudleigh's free behavior in the court of the princess evoked scandalized comments. Horace Walpole describes her at a masked ball in 1749 portraying Iphigenia, "so naked that you would take her for Andromeda." But George II presented her with a watch costing 35 guineas and gave her mother the lucrative post of housekeeper at Windsor. The Chudleighs also owned a 120-acre farm in Devonshire. In 1754 Elizabeth is said to have helped the Prince of Wales (George III) in his intrigue with Hannah Lightfoot.

About 1759 she became the mistress of Evelyn Pierrepont, second duke of Kingston. The liaison was well known when, on June 4, 1760, she gave a magnificent ball to celebrate the birthday of the Prince of Wales. Her parties were now the most fashionable in London. Traveling on the Continent in 1765, at Berlin Frederick the Great paid her some attentions. Desiring to marry the duke without the notoriety of a preliminary divorce, she swore in consistory court that she had never married: the plea was accepted and on May 8, 1769 she married Kingston. Dying four and half years later, he left her his real estate for life and personal estate forever. While she was in Italy, after a brief but characteristically spectacular display of mourning, the duke's nephew Evelyn Meadows had a bill of indictment for bigamy drawn against her. She appeared in the court of King's Bench in May 1775 to answer the indictment, Hervey meanwhile having become earl of Bristol. At the duchess' trial in Westminster Hall before the assembled peers (April 15-22, 1776) her undissolved marriage with Hervey was proved. She escaped from England the day of issuance against her of a *ne exeat regno*.

Retaining her yacht and her large fortune, she lived extravagantly on the Continent, became an intimate of Catherine of Russia, and spent her last years in France.

CHUGACH MOUNTAINS, chōō'gāk, a mountain range in Alaska extending along the southern coast from Cook Inlet eastward for about 280 miles to the western end of the St. Elias Range.

CHUKAR or **CHUKOR**, the Himalayan race (*Alectoris graeca chukar*) of the Rock Partridge, a species (*A. graeca*) which ranges from the Alps of southern Europe to eastern China. It is larger (14½ inches) than any American partridge, a brownish gray bird with a black band across the forehead and completely enclosing the white throat, belly buff, flanks barred with black, gray and chestnut; bill, eye-rim and feet red. It inhabits open country—cultivated land, grass-land and rocky slopes up to snow-line, 16,000 feet in summer. The Chukar is a favorite game-bird and has been naturalized elsewhere, as in Nevada and on the island of St. Helena.

CHUKOT NATIONAL DISTRICT, chōō-kōt', USSR, the easternmost area of the Soviet Union. Its major topographic features are the Chukotski Peninsula (q.v.), the Anadyr Mountain Range, and the Anadyr River with its tributaries. To the west it borders the Yakutsk Autonomous Soviet Socialist Republic, largest division of the USSR, and to the south the Koryak (Koriak) National District. Its area is 254,991 square miles. The capital is Anadyr. Prior to 1930 it formed the northernmost part of Khabarovsk Territory. Sparsely populated, the inhabitants are Chukchi of Paleo-Asiatic origin. The economy is based on reindeer breeding, hunting and fishing. Pop. (1941 est.) 14,983.

CHUKOTSKI, chōō-kōt'skī, or **CHUKOT PENINSULA**, in northeastern Asiatic Russia, situated between Bering Sea to the south and Chuckchee Sea (qq.v.) to the north. Here the Asiatic land mass extends farthest eastward toward the North American continent. At its eastern extremity Cape Dezhnev (East Cape) fronts on Bering Strait. The peninsula forms part of Chukot National District (q.v.).

CHULA VISTA, city, California, in San Diego County; altitude 74 feet; 8 miles south of San Diego; on the San Diego and Arizona Eastern Railroad. It is mostly a residential area, but flowers and vegetables are raised. There is an aircraft plant here. Pop. (1940) 5,138; (1950) 16,505.

CHUMALHARI. See **CHOMO LHARI**.

CHUMBUL. See **CHAMBAL**.

CHUNAR, chū-nār', ancient town and fortress, India, Mirzapur district of Uttar Pradesh, invalid station in Hindustan, 20 miles southwest of Benares, on the Ganges. The fortress stands on a lofty rock rising abruptly from the river. Chunar was stormed by the British in 1763, and formally ceded to the East India Company in 1768. Rice, grain, barley, wheat, and oilseeds are raised. Manufactures include glazed pottery, buttons, and cement. Pop. (1941 est.) 8,654.

CHUNGKING, chōng'k'ing', the wartime capital of China, lies in the central south of Szechwan Province, hundreds of miles beyond the Yangtze gorges, and some 750 air miles from Nanking. It is situated on a series of rugged cliffs at the confluence of the upper Yangtze and Kialing rivers. This ancient but remote city assumed international importance in 1938 when the national government moved its capital from Hankow to Chungking. For several years Chungking suffered constant air attacks by Japan and consequently built an efficient system of air shelters. To promote the development of this area, the national government, during the war, proclaimed Chungking one of the two auxiliary capitals. The city wall of Chungking was built over 500 years ago. Although it was torn down in the 1920's to facilitate modern traffic, remains of the wall and its gates are still in evidence. Chungking was opened to foreign trade in 1891, but it was not until steam navigation was established early in the 20th century that foreign trade in this remote inland port began to develop. Since then modern facilities such as the telegraph, the telephone, and electric light and power have gradually been introduced. The Chinese-Japanese War of 1937-1945 served as an impetus to the modernization of Chungking. Today it is linked with the important cities of China by river, highways, and air lines. Chungking is the key to Szechwan, and the products of this province such as tea, tobacco, and silk are gathered here for transport down the river by junk and steamer, and to cities in the southwest by land vehicles. The population of Chungking increased from about 250,000 in 1937 to over 1,000,000 in 1944 (official est. 1945-1946, 1,002,787). See also CHINA.

CHUQUISACA, choo-kē-sā'ka, Bolivia, department in the southeastern part of the country, bounded on the north by the department of Santa Cruz, on the east by Brazil, on the south by Paraguay and the department of Tarija and on the west by the departments of Oruro and Potosi. Its area is 36,132 square miles. The eastern portion is mostly level, the mountainous parts being in the west. There are large forests and grazing lands, and the soil, where cultivated, is found good for agriculture. Mineral deposits exist, the most valuable being silver, of which some is mined. Among the other productions are wheat, coffee, sugarcane and cacao. The capital of the department is Sucre (q.v.) which was formerly the capital of the republic also. The population is estimated at 400,000.

CHURCH, Albert E., American mathematician and military officer: b. Salisbury, Conn., 1807; d. West Point, N. Y., March 30, 1878. He was educated at West Point and was professor of mathematics there 1834-78. His mathematical works include *Elements of Differential and Integral Calculus* (1842); *Elements of Analytical Geometry* (1851); *Analytical Trigonometry* (1857); *Elements of Descriptive Geometry* (1865).

CHURCH, Alfred John, English translator and author: b. London, Jan. 29, 1829; d. 1912. He was educated at Lincoln College, Oxford; was ordained in the English Church in 1853; professor of Latin in University College, Lon-

don, 1880-88; and rector of Ashley, Gloucestershire, 1892-97. He published translations of Tacitus and Livy. His tales retold from the classics and reconstructions of the histories of the ancient empires of Greece and Rome won him wide popularity on both sides of the Atlantic. *His Memories of Men and Books* was issued in 1908.

CHURCH, Sir Arthur Herbert, English chemist: b. London, June 2, 1834; d. May 31, 1915. He was educated at King's College, London, the Royal College of Chemistry and Lincoln College, Oxford. He was professor of chemistry in the Royal Agricultural College, Cirencester, 1863-79; and filled the same position in the Royal Academy of Arts from 1879 to 1911. He was the discoverer of the animal pigment known as turacin, and of churchite, a native cerium phosphate. He published *Precious Stones* (1883); *English Earthenware* (1884); *The Laboratory Guide* (7th ed., 1894); *Food* (16th thousand, 1901); *Josiah Wedgwood* (1894); *Color* (1887); *Guide to Corinium Museum* (1910); *Chemistry of Paints and Painting* (1901).

CHURCH, Benjamin, American soldier: b. Duxbury, Mass., March 1639; d. Little Compton, R. I., Jan. 17, 1718. He commanded forces with distinction in King Philip's war and in the famous battle of 1675 with the Narragansetts won renown. He captured and executed King Philip in 1676. *Entertaining Passages Relating to King Philip's War* were compiled from his notes by his son Thomas.

CHURCH, Benjamin, American physician: b. Newport, R. I., Aug. 24, 1734; d. 1776. He was graduated from Harvard; and became noted for his patriotic writings in the decade before the Revolutionary War. He secretly corresponded in cipher with the British, and, being detected, failed to exculpate himself. He was lost at sea while on a voyage to the West Indies.

CHURCH, Francis Pharcellus, American editor: b. Rochester, N. Y., Feb. 22, 1839; d. New York City, April 11, 1906. He was the first publisher and editor of the *Army and Navy Journal*; afterward, with his brother, he established and edited the *Galaxy Magazine*. He was a leading editorial writer on the *New York Sun*, and till his death was a proprietor of the *Army and Navy Journal*.

CHURCH, Frederick Edwin, American landscape painter: b. Hartford, Conn., May 4, 1826; d. New York, April 7, 1900. His earliest productions were views of the Catskill Mountains, among which he resided, and a view of East Rock, near New Haven, which attracted very favorable notice. In 1855 he visited South America, and found in the magnificent scenery of that country materials for several of his most admired pictures. After his return he executed his *View of Niagara Falls from the Canadian Shore*, regarded by many as the most successful representation of the great cataract. Among his other works are *The Heart of the Andes*; *Cotopaxi*; *Morning on the Cordilleras*; *Under Niagara*; *The Icebergs*; and *Sunrise on Mount Desert Island*. After a visit to the Holy Land in 1868 he

painted *Damascus* (1869) and *Jerusalem* (1870). His career was cut short in 1877, when his right hand and arm were crippled by rheumatism. Although he learned to paint with his left hand, it too became afflicted, and for the last two decades of his life he was forced to remain inactive. Church was a member of the National Academy of Design, which often exhibited his works.

CHURCH, Frederick Stuart, American illustrator and painter: b. Grand Rapids, Mich., Dec. 1, 1842; d. New York, N. Y., Feb. 18, 1924. He studied painting with Walter Shirlaw and Lemuel Everett Wilmarth in New York, where he exhibited his pictures at the National Academy of Design, to which he was elected a member in 1885. Early in his career he contributed illustrations to *Harper's Weekly*, worked as a commercial illustrator for the Elgin Watch Company, and helped found the Art Students' League of New York (1875). Church is best known as a painter of figures and animals. Among his pictures are *The Sea Princess*; *Moonrise*; *Peacocks in the Snow*; and *Beauty and the Beast*.

CHURCH, George Earl, American civil engineer and explorer: b. New Bedford, Mass., Dec. 7, 1835; d. London, England, Jan. 5, 1910. After several years of practical engineering experience in the United States, he went in 1857 to South America, where he worked as chief engineer of the Great Northern Railway of Buenos Aires and as a member of an Argentine scientific commission exploring the country's southwest border region. Returning to the United States at the outbreak of the Civil War, he served in the Army of the Potomac (1862-1865), and was a war correspondent in Mexico for the *New York Herald* (1866-1867). In 1868 he went once more to South America, where his most important work was connected with the construction of the Madeira & Mamoré Railway between the Bolivian border and northwestern Brazil. In 1880 he was appointed United States commissioner to Ecuador. For the remainder of his life he made his home in London, where he became a fellow of the Royal Geographical Society. His writings include contributions to a number of scientific journals and the posthumous work *Aborigines of South America* (1912).

CHURCH, Irving Porter, American civil engineer: b. Ansonia, Conn., July 22, 1851; d. Ithaca, N. Y., May 8, 1931. He was graduated with a degree in civil engineering from Cornell University in 1873. From 1876 to 1892 he was successively assistant and associate professor of civil engineering at the university, and from 1892 to 1916 professor of applied mechanics and hydraulics.

Church was the author of numerous valuable textbooks on engineering and mechanics, including *Statics and Dynamics for Engineering Students* (1886), *Mechanics of Materials* (1887), and *Hydraulics and Pneumatics* (1889), which were published together in 1890 as *Mechanics of Engineering*, one of the most widely used textbooks in the United States. Among his other works are *Notes and Examples in Mechanics* (1892); *Diagrams of Mean Velocity of Water in Open Channels* (1902); *Hydraulic Motors* (1905); and *Mechanics of Internal Work* (1910).

CHURCH, John Adams, American mining

engineer and metallurgist: b. Rochester, N. Y., April 5, 1843; d. New York, N. Y., Feb. 12, 1917. The younger brother of William Conant Church (q.v.), he was graduated from the Columbia School of Mines in 1867. After metallurgical studies in Europe, he returned to the United States, where he taught at Columbia University (1872-1873) and Ohio State University (1878-1881). As a member of the United States Geological Survey West of the 100th Meridian, he was assigned to make a detailed study of the Comstock Lode, and formed the theory that the presence of heat at the bottom of deep mine shafts was due to chemical action in the rock and not to the earth's fires. Entering the employ of the Chinese government under contract with Li Hung-chang, China's representative with foreign powers, in 1886, Church supervised the reopening of several silver mines in Mongolia, introducing over strong local opposition the use of American methods and machinery. Returning to the United States in 1890, he practiced as a consulting engineer until his death.

His published works include *Notes on a Metallurgical Journey in Europe* (1873); *The Comstock Lode* (1880); and *Report on Artesian Wells in Arizona* (1882).

His son, JOHN ADAMS CHURCH, JR. (b. Prescott, Ariz., Aug. 17, 1885; d. Washington, D.C., Nov. 10, 1952), was also a mining engineer. He was a widely known authority on minerals and collaborated on the *Mining Engineers' Handbook* (3d ed., 2 vols., 1941).

CHURCH, Sir Richard, British military officer and commander in the Greek service: b. Cork, Ireland, 1784; d. Athens, Greece, March 30, 1873. Despite his Quaker upbringing, he enlisted in the British Army at the age of 16. Commissioned soon thereafter, he took part in the Egyptian campaign in 1801. He served subsequently in Malta, Cyprus, and other Mediterranean posts, and in 1809 and 1812 was responsible for creating regiments of Greek light infantry for the defense of the Ionian Islands. His three years of service under King Ferdinand I of the Two Sicilies (1817-1820) were terminated by a revolution in Sicily, where Church had been appointed commander in chief. He was knighted by George IV in 1822.

In 1827, Sir Richard was called to command the Greek insurgent army against the Turks, and after an initial failure to recapture the Athenian Acropolis, was later successful in forcing the surrender of the Turkish garrisons at Missolonghi and Návpaktos (Lepanto). Remaining in Athens after the war, he participated in the revolution of 1843, after which he was appointed a senator under the new constitutional government. In 1854 he became a general in the Greek Army. He continued to live in Athens after his retirement and on his death was given a public funeral.

His nephew, RICHARD WILLIAM CHURCH (b. Lisbon, Portugal, April 25, 1815; d. Dover, England, Dec. 9, 1890), was a clergyman and writer. He was one of the founders of the *Guardian* (1846) and the author of biographies and essays. From 1871 until his death he was dean of St. Paul's Cathedral, London.

CHURCH, Samuel Harden, American industrialist and author: b. Hamilton, Mo., Jan. 24, 1858; d. Pittsburgh, Pa., Oct. 11, 1943. To help support his family, he left school as a youth and

became a messenger boy for the Pennsylvania Railroad Company, in which corporation he eventually rose to be vice president. Meanwhile, he attended and received degrees from several universities and, at its founding in 1896, became a trustee of the Carnegie Institute of Pittsburgh, serving as its president from 1914 until his death. In 1940 he gained worldwide attention by the announcement that he had been authorized to offer a reward of \$1,000,000 for the capture of Adolf Hitler, alive and unhurt, and his delivery to the League of Nations for trial.

Among Church's published works are *Oliver Cromwell: A History* (1894); *John Marmaduke* (1897); *Beowulf*, poem (1901); *Penruddock of the White Lambs* (1907); *A Short History of Pittsburgh* (1908); *The American Verdict on the War* (1915); *Corporate History of the Pennsylvania Railroad Lines West of Pittsburgh* (15 vols., 1898-1920); *Flames of Faith* (1924); and *The Liberal Party in America* (1931).

CHURCH, William Conant, American editor and author: b. Rochester, N. Y., Aug. 11, 1836; d. New York, N. Y., May 23, 1917. The elder brother of John Adams Church (q.v.), he was educated at the Boston Latin School. From 1855 to 1860 he assisted his father, Pharellus Church, a Baptist clergyman, in editing and publishing the *New York Chronicle*. He became publisher of the *New York Sun* in 1860, and, in the following year, Washington correspondent of the *New York Times*, resigning this position on his appointment as captain in the United States Volunteers in 1862. With his brother Francis P. Church, he established the *Army and Navy Journal* in 1863, and in 1866 founded the *Galaxy Magazine*, which he conducted until 1878, when it was merged with the *Atlantic Monthly*. Church was also one of the founders of the Metropolitan Museum of Art in New York, and, with Gen. George W. Wingate, established the National Rifle Association, which he served as its first president.

In addition to numerous articles in various periodicals, he published a two-volume biography of John Ericsson (1890) and *Ulysses S. Grant and the Period of National Preservation and Reconstruction* (1897).

CHURCH, urban district, England, situated in Lancashire, on the Leeds and Liverpool Canal, 20 miles north of Manchester and just west of Accrington. It has plants manufacturing cotton cloth and chemicals for industrial uses. Pop. (1951) 5,199.

CHURCH. The word *church* was probably derived from the Greek adjective *kyriakon* (the Lord's), and referred originally to the building in which Christians met for worship (*kyriakon doma*, the house of the Lord). The English term also conveys the meaning of the Greek word *ekklesia*, which in classical usage meant an assembly, technically a body of citizens summoned by a herald. *Ekklesia* (Latin *ecclesia*) was also used to translate a Hebrew term for the body of those who had been called by God to salvation, and therefore in Christian circles came to mean the community of God constituted by Jesus Christ. In this sense, church refers not only to the visible, institutional aspects of the life of the people of God, but also to the broader totality of the Christian community. This article deals successively

with these three main usages: church as building, church as institution, and church as community of God.

The Church Building.—In the early centuries of persecution, Christians worshipped outdoors, in catacombs, and in private homes. When the Emperor Constantine I (r. 306-337) allowed Christians to worship freely in public, they utilized the Roman basilica as the model for church construction. Basilican churches were long, rectangular, rather low structures with timber roofs supported by long rows of columns. The latter divided the body of the building into a broad, high center aisle (the nave) and two or more side aisles. The eastern end was rounded out into the apse, often domed. Before the apse, on a platform, stood the high altar. This Roman type of church architecture was widespread for several centuries; in Italy its influence persisted into the Middle Ages. (See also *BASILICA*.) In the East, however, Byzantine architecture (q.v.), developed from Roman and Oriental precedents, became popular. This style was characterized by the use of the squared floor plan, domes on pendentives, and rich decorative mosaics. Its influence was especially strong in Eastern Christendom, for in the West the Romanesque development, with heavy walls, round arches, and rounded door and window openings became influential in the early Middle Ages. The floor plan was not rectangular but cruciform; short arms (the transept) were thrust out from the body of the church about two thirds of the way down its length, just before the cancelli, the lattices which separated apse, altar, and choir (the chancel) from the nave. Spires were often added at the point of intersection of transept with nave; one or two towers might also be erected at the entrance end of the church. As this style spread through Europe, it was elaborated in various ways, especially by adding apses to side aisles and transept. (See also *ROMANESQUE ARCHITECTURE*.)

The great period of Gothic architecture came in the 12th to the 15th centuries. The weight of roof vaults was shifted from the walls to lofty, slender stone shafts, counterbalanced by buttresses and flying buttresses. This type of construction permitted the use of pointed arches and thinner walls, and allowed much larger window apertures, thus encouraging the extensive use of stained glass (q.v.). Sculpture was skillfully used throughout the churches and cathedrals of the Gothic period, many of which remain as brilliant monuments to this time of imaginative creativeness. (See also *GOTHIC ARCHITECTURE*.)

The Renaissance promoted a revival of the classical Roman, and in modified form this style influenced the work of Sir Christopher Wren (1632-1723). The plan of his churches was often quite simple: a plain rectangle with shallow chancel. Distinctiveness was added by the originality of tower design. In the 17th and 18th centuries his Georgian style was extensively followed in England (especially after the London fire of 1666) and in America. In the United States in the latter half of the 19th century the Akron theater plan of church building, with corner platform and many small rooms opening onto the main auditorium by great doors, was widely copied. Gothic revivals, which had been influential in the early 19th century in both England and the United States, flowered again in the early decades of the 20th century; their influence

can be seen in a good many of the best-known structures.

Church as Institution.—The term "church" is extensively used to refer to the institutions of religion, both to the local congregation and to the larger entity of an organized communion. Whether Jesus Christ was the "founder" of the Christian Church, or whether He was its "inspirer," and its actual organization followed the Resurrection, is a debated point. The primitive church was characterized by intense ardor and confidence, and by a considerable fluidity. Its members were convinced that Jesus Christ was indeed the Messiah, that He had sent His Spirit and would soon return in glory to usher in the kingdom of God in its fullness. There was place in worship for ecstatic manifestations, especially the "speaking in tongues" under the inspiration of the Spirit. Leadership was provided by apostles, prophets, evangelists, and teachers. How a more formal church organization developed is much debated. Some scholars believe that it matured as the church braced itself against threats of persecution from without and dangers of heresy from within. Others believe that the apostles officially established a hierarchical structure by formally appointing their successors (apostolic succession). It is clear, however, that the replacement of the more informal early arrangements by the threefold ministry of deacon, presbyter, and bishop was almost universally completed in the 2d century. The institutionalization of the church was continued further through the spread of the monarchical episcopate, by which a single bishop in an area occupied a position of authority. The development of the idea of the church as a carefully integrated, universal institution was advanced especially by St. Cyprian (c.200-258). He insisted that there is no salvation outside of the visible church, and that the church was founded on the bishops, so that its every act is to be directed by these same presiding officers. The claim that the bishop of Rome had peculiar authority because he was the successor to Peter, the chief of the apostles, was winning wide recognition by the time of Pope Leo I (r. 440-461); this contributed significantly to the institutional formalization of the Roman Catholic Church. In the high Middle Ages the church was understood to be fundamentally the objective, hierarchical institution of salvation, mediating grace through the sacraments and governing as the representative of God on earth.

Against this formalization, however, came protest movements. For example, in the 2d century the Montanists objected both to what they felt was the increasing externality and the moral laxness of the church. They declared that their "church of the Spirit," marked by prophetic fervor and moral purity, was the true one. Throughout church history there has been an increasing number of institutions, some small and some large, which claim to be true churches. Out of the theological controversies of the 5th century came the separation of the Nestorian and the Coptic churches. In 1054 occurred the definitive separation of Eastern and Western Christendom. The Eastern Orthodox churches include the four ancient Eastern patriarchates (Constantinople, Alexandria, Antioch, Jerusalem) and a number of independent, autocephalous national churches, bound by loyalty to a common faith,

defined chiefly by the first seven ecumenical councils. (See also ORTHODOX EASTERN CHURCH.) In addition to these major divisions, many small sects have arisen at various times to trouble the peace of the church.

The Protestant Reformation in its dominant forms (Lutheran, Calvinist, Anglican) did not so much break with the institutional concept of the church as it challenged the priestly conceptions of its functions. The reformers emphasized that the will of God was revealed not by human institutions but was made known to men through faith in the reading of the Scriptures. Lutherans believed that the true church was where the word of God was truly preached and the sacraments rightly administered; the precise forms of organization were of somewhat secondary importance. Hence Lutheran churches were organized along national lines (the territorial system) as they spread in Germany and Scandinavia in the 16th century. Calvinists added an emphasis on discipline to the marks of the true church, and exhibited a desire to mold society after the will of God. In England both Catholic and Protestant elements were combined as the national established church was redefined under royal supervision. In these Reformation churches the hierarchical structures were simplified or abandoned. The churches of England and Sweden retained the threefold ministry; other Lutheran and the Calvinist churches have generally had no order which is higher than the pastor or presbyter.

Besides the classical Reformation churches there was a vast range of smaller movements, the "left wing of the Reformation." In these little fluid movements sectarian, rationalist, and mystical elements had opportunity to grow. Especially important were the Anabaptists (q.v.). For them the church was an association of adult regenerate baptized believers. They insisted on the independence of the local congregation and magnified the importance of the Scriptures. The sectarian understanding of the church, with its subordination of the institutional aspect, in modified form became widely influential in Protestant life, especially through the evangelical revival of the 18th century. Modern Protestant views of the church have also been influenced by the rationalistic currents of the Enlightenment, in which the idea of the church as a voluntary society was stressed. Some of the great denominations of the English-speaking world hold a view of the church in which classical and sectarian elements are combined. In bodies with congregational polity (for example, Congregational, Baptist, Disciples of Christ) the local congregation is considered to be the valid institutional form of the visible church, though elaborate denominational structures for the achievement of specific educational and missionary goals are maintained. (See also PROTESTANTISM.)

The Reformation was Catholic as well as Protestant; the Counter Reformation encouraged internal reform and vigorously reaffirmed the traditional Roman Catholic understanding of the church, especially at the Council of Trent (1545-1563). A widely accepted Roman Catholic definition of the church, framed by Robert Cardinal Bellarmine (1542-1621), is: "A body of men united together by the profession of the same Christian Faith, and by participation in the same sacraments, under the governance of lawful pastors, more especially of the Roman Pontiff, the sole vicar of Christ on earth." The capstone of

the hierarchical structure was set in place in 1870 by the authoritative declaration of papal infallibility and primacy. See also CATHOLIC CHURCH, ROMAN—*Doctrine*.

Church as Community of the Faithful.—

The idea of the church as the whole community of God's people was extant before the precise, institutional concepts of the church crystallized. Early Christians thought of the church in this way as the chosen people of God, the faithful remnant, the new Israel, the inheritor of the promises made by God to Abraham. Membership in this new and universal fellowship was not by inheritance but was the result of regeneration, the gift of God's grace. The law of the people of God was the new law revealed by Jesus Christ. The members of this corporate body of God's people who by faith had recognized the Messiah felt themselves to be united by a bond of supernatural love, and to be living in a new relationship of dependence and forgiveness. The church was thus "the body of Christ," for He was the Head Who ruled and directed those who were members of the one body and who were dependent on Him and on one another. The church in this sense of the total community of the faithful was not externally visible; it was glimpsed only by the eye of faith. A closely related idea was that of the communion of the saints, which meant that the fellowship of the church transcended the bounds of space and time, that the full unity of the church extended to all places and embraced all ages.

This understanding of the church as a special community, a new and universal people, has always been an important theme in Christian thought. At times it has strengthened the institutional aspects of the life of the church, but at other times it has contradicted them. In the early centuries it was not carefully distinguished from institutional views, but as various schismatic movements appealed to it as justification for their institutional departures, ways of relating the two views had to be found. This was done classically by the great theologian St. Augustine (354–430). He enunciated the doctrine that although the visible church in history could be distinguished from the true body of the faithful who are saved by God's grace, yet there is but one church. Its temporal manifestation, however, must not be confused with its eternal nature. The church in history is not perfect, it is mixed with the ungodly, but at the last in its eternal fulfillment it will be pure. This view rendered schismatic movements more readily controllable and paved the way for the full medieval institutional development of the Roman Catholic Church.

Movements of renewal and reform, however, were still inspired by the understanding of the church as the whole body of the faithful. Certain monastic orders and medieval sects were influenced by it; at times they sought to realize within their own groups something of the reality and vividness of primitive Christian community consciousness. This view also contributed to the thought of such advocates of reform as John Wycliffe (1320?–1384) and the conciliarists who sought to reform the church through general councils.

The Protestant Reformation of the 16th century placed particular stress on the idea of the church as community of the faithful. Martin Luther (1483–1546) emphasized the church as a company of God rather than as an institution

mediating grace. For him, the church was a community which extended over God's world and embraced all ages; it was God's creation, known only by faith. The essential, true church was "inner" Christendom; the external, visible manifestations were but "outer" Christendom. John Calvin (1509–1564) carefully distinguished between the invisible and the visible church. The former was the whole body of the elect, known only to God. The visible church was the training ground for the elect and the instrument for bringing the will of God as revealed in the Bible to bear on the common life; hence its organization could be suited to particular situations.

The smaller Protestant sects also sought to return to the primitive conceptions of church as community, often striving to realize within their memberships the ideal Christian fellowship. This led on the one hand to an emphasis on separation from the world, and on the other to an effort to remold the world after the envisioned ideal. In modified form, sectarian and Calvinist views have been very influential in Anglo-American Protestantism.

ROBERT T. HANDY,

Associate Professor of Church History, Union Theological Seminary.

CHURCH-ALE, formerly a church festival in England at which ale was drunk liberally. The word is similar in its derivation to bride-ale (bridal), scotale, clerk-ale, bid ale, and the like. Church-ales were held in the churchyard, or sometimes in the church, usually at Whitsuntide. Two persons were chosen beforehand to preside over the feast and divide the food and drink contributed by the parishioners. Sometimes the drink which had been brewed from malt given by the parishioners was sold about Whitsunday at the church for the support of orphans and the poor, the repair of the church, and similar purposes.

The practice of holding church-ales with corresponding games was denounced by the Puritans, particularly by Philip Stubbs in *The Anatomie of Abuses* (1583).

CHURCH AND STATE. Before the Christian era religion was usually so closely identified with state or national interests that clear-cut conflicts between the institutions of religion and government rarely developed. In the Roman Empire, for example, the emperor was pontifex maximus, the high priest of the traditional religion; other faiths were in general treated with broad toleration. Between Christianity and the empire, however, tension soon arose. Christians were committed to a loyalty higher than that of the state, they refused to honor the Roman deities, and they made claims as to the universal validity of their faith. Jesus' command to "Render to Caesar the things that are Caesar's, and to God the things that are God's" (Mark 12:17) provided the basis for Christian allegiance to the state, but where the dividing line between the two loyalties was to be placed in given situations was difficult to decide. Varying attitudes toward the state are reflected in the New Testa-

ment. St. Paul's declaration that "the powers that be are ordained of God" (Romans 13:1) is far different from the negative tone with respect to the state that characterizes the Book of Revelation. Throughout Christian history the way in which church and state should be related has been a thorny problem. Church may be entirely separate from state, it may be subject to it, it may be dominant over it, or some form of coordinate authority may be worked out—these various possible solutions have been worked out in theory and tried in practice throughout the succeeding centuries.

During the first several centuries the church was of course independent of the state; the separation was a most unfriendly one, as Christianity was spasmodically persecuted by the empire as an illegal religion. But the faith steadily spread despite attack. In 313, through the influence of the Emperor Constantine I, toleration was officially granted to the church by the Edict of Milan. With the favor and aid of Constantine, the church grew in size and power until by the end of the 4th century it had become the only legal religion in the empire; the intimate connection between church and state that was to endure for centuries was established. In the East, particularly after Constantinople became the sole capital of the empire, the church was subject to the close supervision of the state. This arrangement, known historically as caesaropapism, has often characterized the conditions under which the different Eastern Orthodox churches have lived.

In the West, however, the church often enjoyed a more independent status, particularly after there was no longer an emperor at Rome. To be sure, for some centuries secular authorities exercised considerable control over the church in various ways, but in the medieval period the church rose to a position of dominance over the state. In the medieval Catholic theory of the two swords, the sword of temporal authority was to be wielded by the state, but in the interest of the church and at its direction, for the sword of spiritual authority was held to be superior to all earthly powers. The church rose to its apex of authority during the papacy of Innocent III (1198–1216). He intervened decisively in the most important political issues of his time. He used his influence to have kings disciplined and emperors deposed, and he granted England and some other lands as papal fiefs. He compared the relation of ecclesiastical to civil authority with that of the sun to the moon, the latter shining with the reflected glory of the former.

In the 14th and 15th centuries, however, the rise of national states brought about a new situation in which the power of the church declined. In country after country church interests were subordinated to national interests; the residence of the popes at Avignon (1309–1377) and the Western Schism (1378–1417) both illustrate this trend.

The Protestant Reformation did not at first challenge the close tie between church and state. The principle of religious uniformity enforced by secular authority was believed necessary to civil peace and was affirmed by the major Reformation traditions, Lutheran, Calvinist, and Anglican. Martin Luther (1483–1546) looked to the princes for help in reforming the churches of Germany. Reform in Zurich and Geneva was carried out with the aid of the city councils. In England the

Reformation proceeded under royal direction. But among the great number of small, left-wing sects that arose during the Reformation were many in which any connection between church and state was repudiated on principle. The Anabaptists (q.v.) especially believed that the use of force was foreign to the nature of Christianity, and that the state had no proper jurisdiction in religion. They drew a clear distinction between civil and spiritual offenses. Differences of opinion in matters of religion they thought to be inevitable and legitimate. They agreed that a given religious body should keep its own faith pure by internal discipline, but they were opposed to any outside interference or supervision on principle. Such groups were persecuted by both Catholic and Protestant states in the 16th century, but gradually many Protestants representing the classical as well as the sectarian traditions came to feel that religious liberty was the logical outcome of Reformation principles, and that it could best be safeguarded by the separation of church and state. Especially out of English and American Puritanism, in which Calvinist and sectarian motifs were intertwined, outstanding champions of separation emerged—such individuals as Roger Williams (1603?–1683) and William Penn (1644–1718), and such groups as the Baptists and the Quakers.

In the United States, for the first time in many centuries, a nation of the West without any form of national religious establishment arose. When Protestantism was first brought to North America, less than a century after Luther, the patterns of religious uniformity were generally accepted. In 9 of the 13 English colonies churches were established. But a number of factors—geographic, economic, political, social, and theological—worked together to produce toleration and finally religious liberty. When the Constitution was prepared, separation appeared to be the best way of dealing with the church-state problem and the surest way of safeguarding religious freedom. Article VI provides: "... no religious test shall ever be required as a qualification to any office or public trust under the United States"; and the 1st Amendment declares: "Congress shall make no law respecting the establishment of religion, or prohibiting the free exercise thereof. . . ." (See also *UNITED STATES—Religion and Form and Constitution of the Federal Government*.) This pattern of the friendly separation has spread widely, though in some European countries Protestant state churches remain, in most cases with full religious liberty for dissenters.

In countries such as the United States, where separation has become a fact, Roman Catholics have generally accepted it on pragmatic grounds. Theoretically, and practically where possible, Catholicism officially believes in the union of church and state, affirming that Roman Catholicism should enjoy the favor of the laws and the patronage of public authority. Roman Catholicism has felt that matters of marriage legislation and education especially are within its particular sphere of authority, inasmuch as they deal with matters of faith and morals. These positions have led to some bitter conflicts as modern nationalism has disputed Catholic claims. In France there was a period of unfriendly separation (1795–1801) during the revolutionary epoch. In the effort to regain as favorable a position as possible, the device of the concordat, which has frequently been

used to define the relationship between Roman Catholicism and various states, was used. A concordat with Napoleon in 1801 re-established Catholicism but left it subject to certain limitations. In 1905, France repudiated this concordat, and a period of unfriendly separation that did not ease until after World War I followed. (See also FRANCE—*Church and State*.) In Italy the drive of the nationalists to unify the country succeeded in 1870, and the church was deprived of the remainder of the Papal States. The pope considered himself "the prisoner of the Vatican," and the struggle continued until the Lateran Treaty of 1929 with Italy defined the limits of papal property (Vatican City) and diplomatic relations were restored. (See also ITALY—*History*.) In Germany religious strife broke out in the 1870's as Chancellor Otto von Bismarck attempted to control church activities. Known as the Kulturkampf (q.v.), the struggle ended with the victory of the church. In Latin America about half of the nations have separated church from state; in Mexico particularly there has been sharp conflict between them (see MEXICO—*Church and State*).

A new phase of church-state relationships developed in the 20th century with the rise of Fascist and Communist dictatorships. Christian churches of all traditions resisted absolutist claims made by totalitarian states, and in tense situations have repeated with the apostles: "We ought to obey God rather than men" (Acts 5:29). Among characteristic statements made in the face of Nazi tyranny were the papal encyclical *Mit brennender Sorge* (1937) and the evangelical Barmen Declaration of the Confessional Church in 1934.

CHURCH ARMY, an organization affiliated with the Church of England, founded in 1882 by the Rev. Wilson Carlile (1847–1942), later prebendary of St. Paul's Cathedral, London. Like the Salvation Army, which it resembles, it was established to do mission work in the slums of London and other English cities. It maintains a training school for its workers, lodging houses, clothing and food depots, and employment offices, as well as a fleet of vans which travel throughout Great Britain. In addition, its workers visit prisons.

Branches of the army exist in other parts of the Commonwealth of Nations and in the United States.

CHURCH ASSEMBLY, governing body of the Church of England established by Parliament under the Church Enabling Act of 1919. It consists of a House of Bishops, a House of Clergy, and a House of Laity. See also GREAT BRITAIN—*Church of England*.

CHURCH CALENDAR, the arrangement of the feasts of the Christian Church during the year. Many of the feasts occur on a fixed day

of the month, such as Christmas, December 25; Epiphany, January 6; Assumption, August 15; All Saints', November 1; and the feasts of the saints (see SAINTS' DAYS). Others, which depend on the date of Easter (q.v.), are movable feasts. Thus, Ascension Day is the fortieth day after Easter; Whitsunday, or Pentecost, the seventh Sunday after Easter; and Trinity Sunday, the Sunday following Whitsunday. Since the date of Easter may fall at any time between March 22 and April 25, there is a wide variation from year to year in the dates of these feasts. See also CALENDAR.

CHURCH GOVERNMENT. The system by which the affairs of the local church or congregation and of the denomination are directed. The main principles of church government are derived by various bodies of Christians from the New Testament. Roman Catholics and Episcopalians, Presbyterians and Reformed, Baptists and Congregationalists, whose politics are as different as possible, all believe that their respective systems of church government are derived from the Scriptures, particularly from the Gospels, the Acts of the Apostles, and the Epistles. Apostolic succession is of fundamental importance to the Roman Catholic, the Greek Catholic, and the Anglican communion, and the teaching and practice of the Apostolic Church are, therefore, regarded by them as of binding force. Each traces its succession of bishops, and hence of ordained ministers, back through the ages to one or another of the apostles, and holds that since the time of Sts. Peter and Paul it has had an unbroken succession of the episcopal order. Churches using the presbyterian or congregational order hold that their respective systems are in harmony with the Scriptures and insist that they have a valid ministry. They do not accept the idea of apostolic succession, and do not believe that any particular system is of divine authority, but that churches of Christ are free to adapt their politics to circumstances and conditions, provided that the procedure be orderly. See APOSTOLIC SUCCESSION; also religious denominations mentioned herein.

There are three more or less distinct systems of polity, or church government, generally recognized, known as the congregational, the presbyterian, and the episcopal. There are, however, many modifications or variations of these systems. It is not always possible to determine which particular system a particular denomination employs. The Lutherans in the United States generally classify themselves as congregational; some of them, however, contend that their system is presbyterian, while a few insist that it is really more nearly episcopal. In the Scandinavian countries the Lutheran is the state church and has bishops.

1. The congregational method regards the local church, or congregation, as having full control of its own affairs, and as not subject to legislative or executive direction by any denominational organization or even by the

whole denomination itself. That is, each local church is a complete body in itself with inherent authority to conduct all the business appertaining to itself. The principles of fellowship and cooperation, however, come in to modify any tendency toward strict independency of the local church, which feels that it ought to be related to other churches of like faith and order, and recognizes that fellowship is concerned to know, when a new church is organized and seeks the recognition of other neighboring churches of the same name and order, what are its doctrines, principles, and practices, and when it calls a pastor, to be assured of his standing and qualifications. Hence, associations or conferences of contiguous churches, and councils for recognition, ordination and installation, and hence, also, cooperation in the support of denominational missionary, educational, and other boards or societies. Congregationalists and Unitarians and the various Baptist bodies, with other denominations, accept the congregational system. Baptists and Congregationalists in the last half century have developed denominational conventions and councils for the supervision of general denominational activities.

2. The presbyterial system is government by presbyters, which is another word for elders. Presbyters (John Milton said, "New presbyter is but old priest writ large") are elder ministers, or teaching elders, bishops or pastors, and there are also in each local church ruling elders, who are laymen, and with the pastor constitute the session or consistory. Control in each church is exercised through the session or consistory; then comes the presbytery or classis, composed of pastors and elders of the churches of a district; then the synod, consisting of representatives from presbyteries or classes, and then the general synod or the general assembly, the chief legislative and judicial authority of the denomination. All Presbyterian and Reformed churches use the presbyterial form of government, and, strictly speaking, that of the Methodists is more akin to the presbyterial than to the episcopal polity, although they have bishops. The Methodist bishop is a general overseer or superintendent, but has no legislative power and is subject, under a few constitutional restrictions, to the legislative, executive, and judicial authority of the general conference, the supreme governing body.

3. The episcopal system centers in the bishop. The Roman Catholic Church is governed by the pope as bishop of Rome, which it calls the primal Christian see. He creates cardinals, archbishops, and bishops, calls ecumenical councils at long intervals to advise him, but he is always the supreme head of the church, "the vice regent of Christ on earth." The Anglican Communion and the Eastern Orthodox churches are also episcopally governed, though the state comes in to modify the system somewhat. The Protestant Episcopal Church of the United States has a triennial general convention, composed of two houses, the house of bishops and the house of clerical and lay deputies, the latter elected by the diocesan conventions. This is the supreme legislative body of the church. Concurrence of both houses is necessary to the enactment of legislation. The Methodist Episcopal Church, a type of a number of bodies similarly organized, weds supreme legislative and judicial power in the general conference, a body composed of ministerial and lay delegates elected by the annual

conferences and lay electoral conferences. The bishops preside over its sessions but are not members of it and have no part in its proceedings except as presiding officers. Prior to 1872 this body consisted solely of ministers; since that date laymen have participated in the government of the church. The patronage of the church, the appointment of pastors, is vested by the constitution in the bishops.

The denominations provide judicial courts to determine the validity of ecclesiastical legislation and to try ministers and laymen accused of offenses against doctrine, discipline, and morality, according to the polity in use, recognizing the principle generally that ministers should not be condemned except by tribunals constituted of ministers or of ministers and laymen.

Briefly, the following distinctions are characteristic of the different ecclesiastical polities: In the congregational form, no convention or council has power to legislate for the local churches or to make and enforce rules for their government. The local church is the fountain of ecclesiastical power. In the presbyterial form, the presbytery is the ecclesiastical unit, but with no power of legislation, which instead rests with the denomination in a representative general synod, or general assembly, consisting of representatives of the presbyteries. In the episcopal system, as represented by the Protestant Episcopal Church, supreme power belongs to the denomination, as in the presbyterial form, but bishops have a coordinate power in legislation with clerical and lay deputies of the dioceses, while in the Roman Catholic Church, the bishop holds, in the person of the pope, all power in his hands.

HENRY K. CARROLL,

Author of "Religious Forces in the United States."

CHURCH HISTORY, the history of any church, but especially of the Christian church. Church history naturally divides itself into four periods: from the advent of Christ to the time of Constantine; from Constantine to Mohammed, or by the arrangement of Johann L. von Mosheim and others, to Charlemagne; from Mohammed, or alternately from Charlemagne, to the Reformation; from the Reformation to the present time. This division of the subject is not always followed; some authors regard the great periods in Church history as: Foundation; Persecution; Extension; Reformation. See also **CHRISTIAN CHURCH, THE**.

CHURCH OF ENGLAND. See **GREAT BRITAIN—Church of England**.

CHURCH OF THE NAZARENE. As the result of the union of several small religious bodies the Church of the Nazarene was organized in its present form on Oct. 13, 1908, at Pilot Point, Texas. The three main groups composing this union were the Church of the Nazarene, founded in Los Angeles, Calif., by Dr. P. F. Bresee in 1895; the Association of Pentecostal Churches of America, organized in Brooklyn, N. Y., in 1896; and the Holiness Church of Christ, organized at Pilot Point, Texas, in 1905. The combined membership in 1908 was over 10,000.

The government of the church is representative, a compromise between episcopacy and con-

gregationalism. Each local church enjoys the right to call its own pastor and to manage its local affairs, subject, however, to the guidance of superintendents who are elected by the district assemblies to which local churches send delegates. There were, in 1951, 63 such districts in the United States, Canada, the British Isles, and Australia, each of which meets annually for transaction of business. The general assembly, which meets quadrennially, is composed of equal numbers of ministerial and lay delegates from the various assembly districts and is the supreme legislative body of the church. Five general superintendents, elected by this assembly, have supervision of the entire denomination. The general board, composed of 24 members, ministerial and lay, elected by the general assembly from the various geographical zones and the church departments, promotes the financial and material affairs of all the departments of the Church of the Nazarene, subject to such instructions as may be given by the general assembly. The Articles of Faith, 15 in number, are similar to those held in common by evangelical religious bodies. Special emphasis is placed upon the doctrine of entire sanctification.

Seven colleges are maintained, and the publishing house, the theological seminary, and the denominational headquarters are located at Kansas City, Mo. Missionary work is conducted in over 20 fields throughout the world, engaging the full-time services of about 1,300 missionaries and national workers. At the close of 1951 there were 242,491 members (exclusive of 33,488 on foreign mission fields), 3,790 organized churches, 499,698 enrolled in the Sunday schools, 78,450 affiliated with the Nazarene Young People's Society, and 90,095 members of the missionary organizations. Gifts for all purposes totaled \$27,099,068, a per capita of \$111.76.

REV. VERNON L. WILCOX,

Pastor of the Church of the Nazarene, Medford, Oregon.

CHURCH OF THE NEW JERUSALEM, a body of Christians founded on the writings of Emanuel Swedenborg (Emanuel Swedberg, q.v.). In this church Jesus is directly worshipped as God, in whom is the Father, the Son, and the Holy Ghost. Christ is creator and redeemer, the word and the revelation. The Father is the divine inmost, the divine love; the Holy Ghost is the divine proceeding in and for man. Thus the New Church, as the Church of New Jerusalem is often called, reverses the usual trinitarian view of approach to God through Christ. As to Christ's second coming, Swedenborg held that it occurred when the interior meaning of the Scriptures was revealed to himself in 1757, and that universal judgment accompanied this advent in which the religious beliefs of mankind were overturned and recast. In other words, the New Church means a new dispensation following the apostolic as the apostolic followed the Jewish, and embraces all who acknowledge these three essentials: (1) the divinity of our Lord; (2) the holiness of the Word; (3) the life of love; and who unite with the New Church. The ritual is similar to that of the Anglican Church, except that it is all addressed to Christ as God, and not through Christ to another of the Trinity. Two sacraments are observed—baptism, through which angelic association is formed, and the Lord's Supper, in which

the Lord is not present materially but really in the divine good and truth, which are his body and blood.

Societies of the New Church exist in England and many other foreign countries. There are two divisions of the body in the United States, one known as the General Convention, the other as the General Church.

HENRY K. CARROLL,

Author of "Religious Forces in the United States."

CHURCH RATE, in England, a rate raised for the purpose of repairing and sustaining the established parish churches, churchyards, and other ecclesiastical objects. It was made by the churchwardens with consent of the parishioners, who fixed the amount, but could not refuse it altogether, as in that event the churchwardens were empowered to levy a rate for necessary purposes. Church rates originated in the four charges laid on the tithes (q.v.), one for church edifices, the others for the support of the bishop and clergy and for charity. Used only for parish churches, the rate was assessed against all denominations alike. The Nonconformists objected to contributing to the support of the Established Church, and a similar grievance was held by the predominant Roman Catholic population of Ireland. These difficulties were ended in 1868 by the passing of the Compulsory Church Rate Abolition Act, which provided that church rates are voluntary, not obligatory.

CHURCH STATES, the former dominions of the popes or Roman pontiffs in Italy. Prior to 1870, the Papal States covered a territory stretching across mid-Italy from sea to sea and comprised an area of 16,000 square miles, with a population of 3,124,758. The states originated with the grant of Pepin, king of the Franks, in 754, who bestowed on Pope Stephen II (III) the exarchates of Ravenna and the Pentapolis which the Lombards, against whom Stephen II solicited Pepin's assistance, had taken from the Exarchate of Ravenna. Charlemagne confirmed this grant in 774, and in return received the title of Roman emperor from Leo III in 800. The wise policy of the popes in conferring favors on the Normans in Lower Italy secured to them in these vassals staunch protectors of the holy see. The structure of the papal power was fully completed during the tenure of Gregory VII. The dominions of Countess Matilda of Tuscany were added to the states of the church by her request in 1115, and the popes maintained possession of them against all the claims of the German emperors. The papacy removed a dangerous neighbor belonging to the house of Hohenstaufen by raising the house of Anjou to the throne of Lower Italy in the year 1265. The frequent revolutions of the Romans and the influence of the French led the popes of the 14th century to transfer their residence from 1309 until 1377 to Avignon, which Clement VI bought of Joanna I, queen of Naples and countess of Provence, in 1348. As this change of residence was made—it was charged under the influence of the king of France—it never obtained the full assent of the Romans and Germans, and antipopes were sometimes elected by the opposing factions, and the welfare of the church as well as of the Papal States suffered by their mutual hostilities. After 68 years of exile the popes returned to Rome. Julius II added Bologna to the papal dominions and forced

the Venetians to restore Ravenna, Cervia, Faenza, and Rimini. He was also instrumental in procuring Parma, Reggio, and Modena, although the latter two were restored to private hands in 1515. Ferrara was also recovered from Modena in 1597, and Urbino was bequeathed to the papal chair in 1626 by its last duke, Francesco Maria della Rovere. The wise administration of Sixtus V restored internal order toward the end of the 16th century, but the extravagance and family partialities of some of his successors created fresh disorder. Subsequently Naples renounced her feudal obligations to the papal chair.

After the successes of the French in Italy Pius VI was forced at the Peace of Tolentino (1797) to cede Avignon to France, and Romagna, Bologna, and Ferrara to the Cisalpine Republic in 1798. Then Pius VI was imprisoned and died in France. The victories of the Russians and Austrians in Italy favored the election of Pope Pius VII in 1800 who, under the protection of Austrian troops, took possession of Rome. By the concordat concluded in 1801 with the first consul of the French Republic, the pope precariously regained part of his temporal dominions. In 1807 France again declared war, and the provinces of Ancona, Urbino, Macerata, and Camerino were added to the kingdom of Italy. The possessions of the church beyond the Apennines were all that remained to the pope. On Feb. 2, 1808, a French corps of 8,000 men entered Rome; the remainder of the papal states were added to France and an annual pension of 2,000,000 francs settled on the pope, whose ecclesiastical power was guaranteed by Napoleon. The decree of May 17, 1809, put an end for the time being to the ecclesiastical state. The pope was held a prisoner in France until the events of 1814 again permitted him to take possession of his states the following year.

Pius VII was succeeded by Leo XII, who reigned from 1823 until 1829. He was succeeded by Pius VIII who, in his turn was succeeded by Gregory XVI in 1831 and Pius IX in 1846. The first acts of this pope were characterized by such a liberal spirit that diplomatic Europe was surprised. The events of 1848 caused the pope to pause in his advanced policy, which so dissatisfied the extreme liberal party that they drove Pius IX from Rome, and the reins of government fell into the hands of Giuseppe Garibaldi and Giuseppe Mazzini (1849) of the Roman Republic. Some few months afterward the French government, resolving to restore the papal authority, sent Gen. Nicholas C. V. Oudinot with an army against Rome. Defeated in their first attack on the city, the French began a siege in regular form and in a month's time were masters of it. Pope Pius did not return to Rome, however, until the following year.

After the Austro-Italian War of 1859, the papal see was stripped of the greatest part of its territorial possessions. Embracing before that date an area of 16,000 square miles, with 3,124,758 inhabitants, the Roman territory was then reduced to 4,891 square miles, and 692,106 inhabitants. Of the former legations and delegations into which it was subdivided only five remained—namely Rome and the Comarca, Viterbo, Civit  Vecchia, Velletri and Frosinone. From 1860 to 1866 the papal government was sustained by the presence of a French Army, which was withdrawn in 1866 upon the king of Italy binding himself by treaty to respect the integrity of the Roman states. In 1867, however, revolutionists

numbering 15,000, belonging to the Italian party of action, entered the papal territory, headed by Menotti Garibaldi. They made but little progress until the elder Garibaldi placed himself at their head. Napoleon III, at the earnest prayer of the pope, sent an army to protect the city against the violence of the revolutionists, who had now surrounded it. On October 28, the French entered Rome, and Garibaldi, beginning to perceive that he would be hemmed in by the regular Italian forces under Enrico Cialdini, thought of retreating. An advanced section of the papal troops came in contact with the Garibaldians (November 3), and were likely to have suffered severely had not two French battalions come speedily to their aid. Garibaldi, with 4,000 men, retreated into the Italian territory, where they were disarmed. A strong force of French troops were left in occupation of Civit  Vecchia after peace was restored and the pope seemed as secure as ever. But the outbreak of the Franco-German War changed the aspect of affairs. The French army of occupation left Rome on July 20, 1870, and the pope was at the mercy of his powerful neighbor, Victor Emmanuel II, king of Italy, who, seizing the opportunity, marched upon Rome and took it by force of arms. In September the Italian troops occupied Rome. In October the states of the church were incorporated with the kingdom of Italy, a plebiscite was held under bayonet rule, the count of which resulted in 133,681 in favor of the Sardinian occupation and 1,807 against it. In the beginning of July 1871, Rome became the seat of the Italian government and the residence of the court. An Italian law of May 13, 1871, guaranteed, besides possession of the Vatican and Lateran palaces and the villa of Castel Gandolfo, an annual income to His Holiness the Pope and his successors forever of 3,225,000 francs. The Lateran Treaty of 1929 settled the Roman question. Vatican City was created as a separate state, with full temporal power of the papacy together with adjustment of financial differences.

CHURCHES OF CHRIST. Though these churches are all free and independent of any general hierarchy, each local congregation having elders to oversee its affairs and deacons to assist them, yet they are united in a common faith and voluntarily cooperate in sending missionaries and in doing benevolent work under the direction of local churches. Membership depends only on (1) faith in and confession of Jesus Christ as the Son of God; (2) repentance from sin; (3) baptism by immersion. Their worship consists of the five acts specifically authorized by the New Testament: (1) reading and preaching the Bible; (2) observing the Lord's Supper as a memorial; (3) contributing money to the Lord's work; (4) praying; (5) singing (*a cappella*) psalms, hymns, and spiritual songs.

In faith and practice they date back to the founding of the church of the New Testament on the first Pentecost after Jesus' resurrection. They call for a complete return to the New Testament, and seek to restore in their worship, organization, and life the pattern of New Testament Christianity. Rejecting all party names, creeds, and organizations in their abhorrence of divisional denominationalism in Christendom, they plead for unity of all believers on the basis of the Bible alone.

The very nature of this fellowship of free

Christians makes it impossible to trace without interruption specific groups back to the day of Pentecost. It is known that during the 17th century there were Churches of Christ in England. Late in the 18th century a restoration movement swept over the United States and resulted in a rapid growth of such churches. In at least six different sections of the new nation men independently began to preach a return to the Bible, urging their hearers to become Christians only, and not to affiliate with any sect. In 1860 these churches counted 192,323 members; by 1875 there were some 400,000 members. In the last quarter of the 19th century there came a division. The tide of liberalism, later known as modernism, began to sweep many leaders away from a fundamental faith in the New Testament as an all-sufficient guide in matters of faith and practice. The simplicity of both the organization and the worship of many churches was changed by the institution of an overall missionary society to control the mission work of the brotherhood and by the introduction of mechanical instruments of music into the worship. These innovations were followed by open membership, modernistic theology, clericalism, and ecclesiasticism. The fundamental difference developed in the attitude toward the Bible as divine authority. A majority of the churches digressed from the original position and formed the denomination of the Disciples of Christ (q.v.). By 1906 this division was complete and was recognized by the Bureau of the Census.

CHURCHILL, Charles, English satirist: b. Westminster, England, Feb. 1731; d. Boulogne, France, Nov. 4, 1764. Achieving a measure of fame as a satirist during the last four years of his life that outweighed even that of such contemporaries as Samuel Johnson, Tobias Smollett, and William Hogarth, the elephantine figure of Churchill has faded almost to obscurity in the 20th century, his satires becoming mere historically interesting commentaries on 18th century mores in England.

The son of an English rector, Churchill was denied entrance to Cambridge University (some say because of his marriage at 17 years of age) and, after living in northern England and London in various stages of poverty, was ordained a priest in 1756, obtaining an ill-paid curacy that year in Essex. Two years later he was offered his father's curacy in Westminster and lived there for three years in obscurity. He wrote his first satires there but was unsuccessful in getting them published.

In 1761 he published at his own expense *Rosciad*, a satirical attack on contemporary actors that soon swept the country and rocketed him to fame. His next satire, *Apology Addressed to the Critical Reviewers* (1761), was an attack on Smollett, who had bitterly criticized *Rosciad* in his *Critical Review*, and again on contemporary actors, this time including David Garrick and prompting the latter to write Churchill's friend, Robert Lloyd, praising Churchill and attempting to cultivate his acquaintance.

Churchill was soon able to pay off all his debts and lived thereafter in such high fashion that his parishioners objected and forced him to resign his curacy in 1763.

In 1762 he became friends with the great political reformer, John Wilkes, and regularly contributed articles to his review, the *North Briton*,

an anti-Bute publication. In 1763 Churchill came out with a series of satirical verses: *The Prophecy of Famine*, an anti-Scottish poem severely condemned by Boswell; *An Epistle to Hogarth*, attacking the great caricaturist's cartoon of Wilkes; *The Duellist*, a defense of Wilkes and a bitter satire of Wilkes' enemies, the earl of Sandwich, William Warburton, and the earl of Mansfield; *The Ghost*, ridiculing Johnson's Cock Lane story. His publications in 1764 put forth his political tenures in *Gotham*, considered by many as his best piece; continued his satirical attack on the enemies of Wilkes in *The Candidate*; and prophesied his own death in *The Farewell*.

His other works were *Night* (1762); *The Conference* (1763); *The Author* (1763); *The Times* (1764); *Independence* (1764), noted for his portrait of himself; and *The Journey* (published posthumously). He died of fever on his way to meet the exiled Wilkes.

CHURCHILL, LORD Randolph Henry Spencer, English statesman, 3d son of the 7th Duke of Marlborough: b. Feb. 13, 1849; d. London, Jan. 24, 1895. He was educated at Merton College, Oxford, and entered Parliament in 1874 as member for Woodstock. After the Conservative debacle in 1880, he formed what was half satirically known as the Fourth Party, consisting usually of four members, who took up an attitude of uncompromising and even obstructive opposition to the measures of government, and one also of frank and brutal criticism of the "old gang," as Lord Randolph called the official opposition leaders. So well did he employ his powers of ready and extensive criticism, both in the House and in the country, that on the accession of the Conservatives to office in 1885, he became secretary for India. His tenure of this office was rendered notable by the annexation of Upper Burma. On the defeat of Gladstone's Home Rule bill in 1886 and the return of the Unionist Party to power, Churchill became leader of the House of Commons and chancellor of the exchequer. In his leadership of the House he showed tact, judgment, and resource; but on December 23, of the same year, owing to demands made by the ministers responsible for the army and navy for increased outlays, to which he was opposed, he caused a sensation by unexpectedly resigning office. Subsequent events showed this to be an act of political suicide, for he never regained his old place in the party councils. A man of great natural abilities, and of boundless ambition, with marvelous political insight and debating and oratorical talent of a high order, he had at the same time the defects inseparable from an unstable nervous system. In 1874 he married Jennie Jerome, a daughter of Leonard Jerome, of New York. In July 1900, Lady Randolph Churchill married George Cornwallis West. She died June 29, 1921. His elder son, Winston Leonard Spencer Churchill (q.v.), inherited his father's political abilities.

CHURCHILL, William, American philologist: b. Brooklyn, Oct. 5, 1859; d. Washington, D.C., June 9, 1920. Graduated at Yale in 1882. In 1896 he became consul general to Samoa, also judge of the consular court and receiver and custodian of the revenues of Samoa. In 1897 he was also made consul general to Tonga. In 1902-1915 he was a member of the editorial staff of the *New York Sun*. He edited the *Malayo-Poly-*

nesian department of the *Standard Dictionary* in 1912. He was a fellow of the Royal Anthropological Institute and of the American Philological Association. He wrote *A Princess of Fiji* (1892); *Polynesian Wanderings* (1910); *Beach-la-Mar* (1911); *Easter Island, Rapanui Speech and the Peopling of Southeast Polynesia* (1912); and *The Subanu* with John Parke Finley (1913).

CHURCHILL, Winston, American novelist: b. St. Louis, Mo., Nov. 10, 1871; d. Winter Park, Fla., March 12, 1947. He was educated in the public schools of St. Louis and at the United States Naval Academy, Annapolis, and graduated from the latter institution in 1894. He was a member of the New Hampshire legislature, 1903-1905, and was a candidate on the Progressive ticket for governor of New Hampshire in 1912, but failed of election. He wrote several successful novels and many articles for magazines. His novels include *The Celebrity* (1898); *Richard Carvel* (1899); *The Crisis* (1901); *The Crossing* (1904); *Comiston* (1906); *Mr. Crove's Career* (1908); *A Modern Chronicle* (1910); *The Inside of the Cup* (1913); *A Far Country* (1915); *The Dwelling Place of Light* (1917); and *The Uncharted Way* (1940).

CHURCHILL, Sir Winston Leonard Spencer, British statesman and man of letters: b. Blenheim Palace, Oxfordshire, Nov. 30, 1874. He was the elder son of Lord Randolph Henry Spencer Churchill and Jennie (born in Brooklyn, N. Y., in 1850), daughter of Leonard Jerome, owner of the New York *Times* and a banker. His love of soldiering as a young man, and the sound strategical concepts he displayed in later years, were traits which he had in common with his great ancestor John Churchill, 1st duke of Marlborough. A man of many parts, with a great zest for life, he was an ardent polo player in his youth, learned to pilot an airplane, took out a union card as a qualified bricklayer, and in later years developed considerable skill as a landscape painter. The talent he showed in so many fields reached its height in his long career in politics. His mastery in debate, his brilliance as an orator, his independence, rank him among the greatest figures in British history. In his speeches, so carefully prepared and rehearsed, and in his forceful and lucid writings, he exhibits a command of the English language that has seldom been equalled.

After attending Harrow, where he coupled a conspicuous distaste for Latin with an early enthusiasm for his own language, he was admitted to Sandhurst Military Academy (the British "West Point") at the third attempt, and on being commissioned in 1895 he was gazetted to the 4th Hussars. The same year, while on leave, he visited Cuba as an observer in the Spanish campaign against the guerrillas, and in 1896 he obtained a transfer to the Indian Army. In India he studied philosophy, history, and economics, and during 1897, as an officer in the 31st Punjab Infantry, he served on the Northwest frontier in the Malakand and Tirah operations. On these campaigns he was war correspondent for the Allahabad *Pioneer* and the London *Daily Telegraph*, and from this experience came the first of his numerous books, *The Story of the Malakand Field Force* (1898), a best seller, in which he dared to criticize his superior officers. *Savrola*, his undistinguished and

only attempt at fiction, was serialized by *Macmillan's Magazine*, and appeared in book form in 1900. Sir Herbert (later Lord) Kitchener accepted him with reluctance in 1898 for service in the Egyptian campaign for reconquest of the Sudan; riding with the 21st Lancers in the battle for Omdurman, he participated in one of history's last classic cavalry charges. He reported the campaign for the London *Morning Post*, and later recorded it in *The River War* (1899), another highly critical, though accurate, work. Deciding to abandon army life for politics, in 1899 he contested the Oldham parliamentary division as a Conservative; and after failing to win the seat, he sailed for Cape Town, to report the South African War for the *Morning Post* at the highest salary yet paid to a war correspondent.

When an armored train in which he was riding in November 1899, two weeks after arrival, was ambushed by the Boers in Natal, he helped in the defense and was taken prisoner by Louis Botha—who later, and largely with the support of Churchill, became the first premier of the Union of South Africa. Because of Boer clemency he was not shot for exceeding the functions of a journalist, but was imprisoned at Pretoria, whence he escaped within a month with a price on his head. Making his way across Portuguese East Africa, he reached Durban, in Natal, where he was commissioned lieutenant in the South African Light Horse; he saw a good deal of the subsequent fighting up to the capture of Pretoria, where he helped release his erstwhile fellow prisoners. He gave an account of his experiences in *London to Ladysmith via Pretoria* (1900) and *Ian Hamilton's March* (1900).

Back in England before the end of 1900, he stood once again as parliamentary candidate at Oldham, on this occasion successfully. Soon, in the House of Commons, he assailed the policies of the Conservative government under whose banner he was supposed to be serving, opposed increases in the army, and urged leniency to the Boers. The tariff reform proposals of Joseph Chamberlain in 1903 met with his uncompromising opposition, and over this issue he left his party in the summer of 1904. At the early age of 31 he obtained his first ministerial post, the minor one of undersecretary of state for the colonies, in the Liberal administration formed in 1905 by Sir Henry Campbell-Bannerman. At the ensuing general election he was returned to Parliament by the Northwest Manchester division, and since his chief, the 9th earl of Elgin, was seated in the Lords, he became the spokesman for his party in the Commons. His ability in piloting legislation to transform the Transvaal and Orange Free State into British colonies presaged the brilliant future that lay ahead. The year 1906 saw publication of his life of *Lord Randolph Churchill*, an authoritative 2-volume biography by an admiring son; and in *My African Journey* (1908) he recorded a tour through East Africa from Mombasa to the Sudan by way of Uganda.

In 1908, now 33 years old, he became president of the Board of Trade in the cabinet reconstructed by Herbert Asquith; in that year, too, he married Clementine Ogilvy Hozier, "and," as he later confessed, "lived happily ever afterwards"; they were to have a son and four daughters. Repudiated at Northwest Manchester, he was elected by the voters of Dundee, and now he showed his interest in social legislation by

sponsoring labor exchanges and helping to create unemployment insurance. For his support of the budget of David Lloyd George imposing much additional taxation, he was denounced as a traitor to the wealthy class to which he belonged. Transferred to the cabinet post of home secretary in 1910, he reduced or cancelled numerous prison sentences and sought to ameliorate the rigors of imprisonment. Attacks were made upon him in Parliament and the press for his part in the "battle of Sidney Street," a siege of foreign criminals in a London slum on Jan. 3, 1911. Before he left the Home Office, he secured passage of bills setting up a minimum wage in certain sweated industries, limiting hours of work in shops, and protecting coal miners.

Disagreement between army and navy heads as to the strategy to be adopted in event of war, and the aspirations of Kaiser Wilhelm II for "a place in the sun," clearly indicated in 1911 the need for a strong man at the Admiralty. Churchill was the obvious choice for first lord, and as soon as he assumed his duties he planned a great increase in naval strength; before long, too, he created the navy's first air service. In July 1914, acting entirely on his own responsibility, he forbade dispersal of the fleet after a royal review off Spithead, with the result that, when hostilities commenced two weeks later, the British Navy was already fully mobilized. He personally accompanied a British naval landing force to Antwerp the following October, and though it failed to defend the city, the German advance was slowed and the Channel ports were thus saved. The Dardanelles campaign of 1915, for which Churchill had pressed, proved a blunder because of the inadequacy of others; a public quarrel with Admiral Lord (John Arbuthnot) Fisher and a cabinet crisis followed. With the formation of a Coalition government Churchill was ousted from the Admiralty, and in November 1915, after a short tenure of the minor cabinet post of chancellor of the duchy of Lancaster, he resigned.

Forthwith he went to the western front as a major in the 2d Grenadier Guards, and then was given command of the 6th Royal Scots Fusiliers with the rank of lieutenant colonel. He resumed his seat in the House of Commons in the autumn of 1916, and the next year succeeded Lloyd George, then prime minister, as minister of munitions. In 1915, while at the Admiralty, he had been one of the first to encourage development of the tank, and now he put an improved model into large-scale production; German Gen. Erich Ludendorff is authority for the statement that in no small measure the tank decided the later course of World War I.

In the reorganized Coalition cabinet of 1919 he was made secretary for war and air minister, and soon was widely denounced for bolstering up the White Russians in their futile struggles against the Bolsheviks. Appointed colonial secretary in 1921, his main preoccupation was with the many problems of the Middle East; and he also participated in the negotiations resulting in establishment of the Irish Free State. He went into temporary retirement when repudiated by the Dundee electors in the 1922 general election. During this period he turned once more to writing, preparing the first installments of *The World Crisis* (1923-1929), a colorful 5-volume record of World War I in which he strongly de-

nounced the costly strategy employed on the western front.

When Churchill again entered the political arena, in 1924, he offered himself as an independent anti-Socialist, attacking the Labour Party which had by now supplanted the Liberals as senior opposition to the Conservative government. Unsuccessful in the Westminster Abbey parliamentary division, he secured election at Epping, once more as a Conservative after an absence from the party of nearly 20 years. He was appointed chancellor of the exchequer in the cabinet of Stanley Baldwin, and presented to Parliament five successive annual budgets; in the first, he returned Britain to the gold standard, a step that proved ultimately disastrous and precipitated the general strike of 1926.

The advent of the Labour Party to office in 1929 left him once more without a ministerial post, though still with a seat in the House. He made a lecture tour in the United States in 1930, traveled much in Europe, and again took up his pen. In rapid succession he published *My Early Life* (1930; New York ed., *A Roving Commission*, 1941), a lightly written autobiography; *The Eastern Front* (1931), a supplement to *The World Crisis*; and *Thoughts and Adventures* (1932), a pleasant miscellany. These were followed by the four-volume *Marlborough, His Life and Times* (1933-1938), a powerful vindication of his hero; the well-informed *Great Contemporaries* (1937); *Arms and the Covenant* (1938), a volume of speeches; and *Step by Step* (1939), a collection of his newspaper articles.

As early as 1932 he was warning his countrymen against the resurgent might of Germany, but his voice was unheeded by a Britain which trusted that appeasement would mollify Adolf Hitler. Averse to changes in British constitutional affairs, he fought the Government of India bill of 1935 giving a more liberal measure of self-government to that country; in 1936 he was the one man of public fame to defend Edward VIII when confronted with the choice between a wife of his own choosing and the crown; and in 1937 he assailed the release of the British naval ports in southern Ireland to Eamon de Valera. Although these denunciations of Conservative policies effectively debarred him from a cabinet post, he was not to be intimidated—and in some matters time was to bring his justification.

With Britain and France humbled by the German annexation of Austria and the partition of Czechoslovakia, public opinion rallied behind Churchill, and when war was declared on Germany, Sept. 3, 1939, he was the country's instinctive choice for first lord of the admiralty. Resuming the post he had occupied when World War I broke out a quarter of a century earlier, he inspired the nation with such confidence that, on April 4, 1940, he was given supreme administrative command of all naval, military, and air forces. On May 10, as German troops poured into the Low Countries, he succeeded Neville Chamberlain as prime minister and assumed the added post of minister of defence. "I have nothing to offer but blood, toil, tears and sweat," he told the House of Commons. "... You ask, what is our policy? I will say: It is to wage war, by sea, land, and air, with all our might and with all the strength that God can give us. ... You ask, What is our aim? I can answer in one word—Victory."

The career of Churchill in the war years

that followed epitomizes the history of Britain. In 1940, while stirring the nation to immense efforts to avert invasion, he took the momentous decision to send to Egypt Britain's sole remaining armored division—so that the highway to Asia might be preserved. With German submarines sinking much British shipping, in 1941 he procured from the United States 50 over-age destroyers in exchange for leased bases in the British West Indies. When demands for a second front in western Europe became insistent in 1942, he convinced the Russians that such a course, if taken prematurely, might end in a disaster which would delay German defeat for many years. None gave more enthusiastic support than he to the Allied plans for landing in North Africa in 1942 and in Normandy 18 months later.

In loyalty to Britain's allies he was unwavering. When France was defeated and about to seek an armistice with Germany, he appealed to her to hold fast, even suggesting an amalgamation of the two states, with a common citizenship and joint organs of government, by means of a solemn act of union. Nor did he lose hope for her: "Never will I believe that the soul of France is dead. Never will I believe that her place among the greatest nations of the world has been lost for ever!" Such faith was demonstrated in the continued support he gave to Gen. Charles de Gaulle, unchanged even when the British Navy sank French warships anchored at Oran: "I leave the judgment of our action, with confidence, to Parliament. I leave it to the nation, and I leave it to the United States. I leave it to the world and history." Despite this friendship, however, he sent de Gaulle a peremptory request in May 1945 to cease fighting the young Levantine republics.

For 20 years an avowed enemy of the Soviet regime, he set aside old animosities when the Germans invaded Russia in 1941: "Any man or state who fights on against Nazidom will have our aid. Any man or state who marches with Hitler is our foe." Twice Churchill flew to Moscow to meet Marshal Stalin, and with President Franklin D. Roosevelt he conferred with Stalin at Teheran and at Yalta. Churchill was also responsible for the ratification in 1942 of a 20-year treaty of friendship between Russia and Great Britain. He was on terms of close friendship with President Roosevelt from the time they met off the Newfoundland coast to draft the Atlantic Charter, August 1941. At Washington, in December of that year, they set up a Combined Chiefs of Staff organization for joint direction of the war; and before a joint session of Congress Churchill avowed his "hope and faith, sure and inviolate, that in the days to come the British and American peoples will for their own safety and for the good of all walk together side by side in majesty, in justice, and in peace." He visited the United States again the following June, and in 1943 and 1944 after conferences at Quebec. He met President Roosevelt in North Africa at the close of 1942, and a year later, at Cairo, the two leaders conferred with Chiang Kai-shek and President İnönü of Turkey.

Despite the fact that, as premier, Winston Churchill traveled 150,000 miles by air to visit the fighting fronts, and to confer with Allies and neutral nations, he never lost contact with domestic affairs. While departmental matters were handled by members of his Coalition cabinet, he guided much of the postwar planning. In

March 1943 he put forward a 4-year plan for reconstruction after conclusion of hostilities, and the next year sponsored numerous proposals for domestic reform: an enlarged social insurance plan, extending that which he, as a Liberal, had introduced 30 years earlier; health services which were to be freely available to everybody; and a partnership of the state with private enterprise to restore the export industries without which Britain could not survive.

It was in the war years, perhaps, that his rich and colorful oratory reached its heights, though his speeches sometimes lacked measure, he used too many adjectives, and he constantly interrupted the evolution of his theme to catch some image or some phrase which had glittered at him from the outskirts of his mind. Nevertheless the benches were packed when he spoke in the House, the sound of his voice varying in tone from lusty recital to half-humorous comment; and for his memorable broadcasts he had all the world for an audience. After the remnants of the British Army had been evacuated from Dunkirk, he promised Parliament: "... we shall fight on the beaches, we shall fight in the fields and in the streets, we shall fight in the hills; we shall never surrender"; and two weeks later: "Let us therefore brace ourselves to our duties, and so bear ourselves that, if the British Empire and its Commonwealth last for a thousand years, men will say, 'This was their finest hour.'" During the Battle of Britain he paid tribute to the Royal Air Force: "Never in the field of human conflict was so much owed by so many to so few." When suggestions came from across the Atlantic in 1942 as to the future status of dependent peoples, he warned: "We mean to hold our own . . . I have not become the King's First Minister in order to preside over the liquidation of the British Empire." At Harvard, on receiving an honorary degree in 1943, he said: "Let all of us who are here remember that we are on the stage of history, and that whatever our station may be, whatever part we have to play, great or small, our conduct is liable to be scrutinized not only by history but by our own descendants."

He led his country through nearly six years of war against Germany, yet, despite his proven record as a war leader, he and his Conservative Party were repudiated by the voters before the peace had been made, Labour winning a decisive victory at the general election in July 1945. Although he retained his seat in the House of Commons, Churchill vacated the premiership in favor of Clement Richard Attlee, and in a valedictory expressed his profound gratitude to the British people for the kindness "shown toward their servant."

In addition to leading the Opposition in Parliament, Churchill turned once more to writing, recording his memoirs of World War II in a succession of notable volumes under the general title *The Second World War: The Gathering Storm* (1948); *Their Finest Hour* (1949); *The Grand Alliance*; *The Hinge of Fate* (both volumes published in 1950); *Closing the Ring* (1951); and *Triumph and Tragedy* (1953). In the general election of October 1951 he led his Conservatives to a slim Parliamentary majority, and as prime minister, he acclaimed the accession of Queen Elizabeth II in 1952: "I, whose youth was passed in the august, unchallenged, and tranquil glories of the Victorian era, may well feel

a thrill in invoking once more the prayer of the anthem—*God Save the Queen!*" It was as prime minister and newly created Knight of the Garter (April 1953) that he attended the coronation, wearing the great Garter badge of his ancestor, the 1st duke of Marlborough.

In the later years of his life, his interests proved no less varied than in his youth, and the honors bestowed upon him demonstrated the esteem in which the free world held him. In an exhibition at the Royal Academy in May 1953, Sir Winston was represented by five canvases, all of which were praised by the critics. In the following month he established a foundation for cultural exchange between Great Britain and Denmark. The original endowment had been presented to him by the people of Denmark as a demonstration of their gratitude when he received an honorary doctorate of philosophy at the University of Copenhagen in 1950.

Sir Winston's often expressed belief in the efficacy of personal contact between heads of state was again illustrated when, in January 1953, he journeyed to Washington to hold talks with both the outgoing and the incoming administrations. At the same time he visited Canada to confer with officials there on several problems, including Southeast Asia. Later in the same year (December 1953) he attended a conference in Bermuda between the heads of governments of Great Britain, France, and the United States.

In October 1953, a month before his 79th birthday, Sir Winston received the Nobel Prize for Literature. He resigned as prime minister on April 5, 1955.

WHEELER B. PRESTON.

CHURCHILL, river, Canada, rising in Lake la Loche, Saskatchewan Province, and flowing for about 1,000 miles east and northeast across Manitoba to enter Hudson Bay at Churchill. The largest of numerous lakes through which it passes are the Churchill and Snake in Saskatchewan, and the Granville and Southern Indian in Manitoba. Its chief tributaries are the Reindeer and the Beaver.

CHURCHING OF WOMEN, a rite founded on the Mosaic injunction given in Leviticus 12:6-8. As now practiced in some denominations, it is a giving of thanks for the birth of a child. The first mention of the subject as a usage in the Christian Church is found in the pseudo-Nicene Arabic Canon, but no prescribed form is given.

CHURCHYARD, *chŭrch'ĕrd*, Thomas, English poet and miscellaneous writer: b. Shrewsbury, about 1520; d. London, April 4, 1604. From 1541, Churchyard fought as a soldier of fortune in many campaigns in France, the Low Countries, Ireland, and Scotland. After 1560 he poured forth a great number of broadsides, pamphlets, and larger works, and was frequently employed to supply verses for court masques and pageants. His *Churchyard's Choise* (1579) proved offensive to Queen Elizabeth and he was forced to take refuge in Scotland for three years. He wrote *The Legend of Shore's Wife* in *The Mirror for Magistrates* (1563), a publication prepared by William Baldwin; *The Worthiness of Wales* (1587), and various autobiographical pieces. In *Colin Clouts Come Home Again* (1595), the eclogue by Edmund Spenser, he was styled "Old Palaemon."

CHURL (Saxon *ceorl*), in modern usage, a rude, boorish person, but in Saxon England the term denoted a common freeman. The rank of churl, or *ceorl*, steadily declined until finally the only important distinction between churl and serf was that the former might choose his own master. The better class of churls sometimes found their way into the class of theynes, or thanes, corresponding to the knights of post-Conquest times, while the others became the villeins of the Norman feudal organization. *Doomsday Book* (*Domesday Book*, q.v.) makes no mention of the word *ceorl*.

CHURN, a container in which milk or cream is stirred or beaten to separate its oily globules in a solid mass from the fluid portions, and thereby to obtain butter. Churns are of two principal types. The cylindrical, barrel-shaped type is rotated end-over-end while a paddle on the inside stirs the milk or cream; it is equipped with a valve to allow the escape of gas formed during the process of butter making, and a faucet to allow the buttermilk to be drained off. The fixed type remains stationary while the beaters, attached to a rod passing through the center of the container, are rotated by motor power. The churns commonly used by early American housewives, and still used occasionally on farms by families who wish to make their own butter, consist of a hardwood barrel with a straight rod projecting downward through the cover and attached below to the dasher. By plunging the rod up and down vigorously, butter could be manufactured in about 45 minutes. The small quantity of butter thus produced, however, and the strenuous effort required by this hand process, eventually led to the invention of the large motor-driven churns of modern times which are capable of producing large quantities of excellent butter in a short time. See also BUTTER; DAIRY PRODUCTS.

CHURRIGUERESQUE, *chōō-rĕ-gā-rĕsk'*, the term used to describe that distinctively Spanish post-Renaissance style in architecture which combines the baroque and the rococo. It takes its name from José Churriguera (c.1650-1725) who was royal architect in the reign of Charles II and through his two sons and his pupils dominated Spanish architecture in the first half of the 18th century. Its most striking and unrestrained development was in Mexico. See also MEXICO—Architecture.

CHURRUS, *chŭr'ŭs*, or **CHARAS**, *chŭr'ās*, the resinous exudation of the leaves and flowers of Indian hemp, *Cannabis indica*. It is used by the natives of India as an intoxicating drug. See also HASHISH; HEMP.

CHURUBUSCO, *Battle of*, *chōō-rōō-bōōs'kō*, one of the principal engagements of the Mexican War, took place Aug. 20, 1847. Contreras (q.v.) was won in the early morning. Churubusco in the forenoon and early afternoon of that day, but they are quite distinct battles. Gen. Winfield Scott was in command of the American forces. The main road north to the City of Mexico, via San Agustín and San Antonio, an elevated paved causeway, converged with that on the west from Contreras and Coyoacán at Churubusco, a village six miles south of the capital and a mile northeast of Coyoacán. Just

north of it ran east and west the little stream called Río Churubusco, crossed by the main road at a bridge fortified with a bridgehead. In the western part of the village, southwest of the bridgehead, on the Coyoacán road, was the Convent of San Pablo, a massive building with walls so thick that fieldpieces could make no impression on them, defended on two sides by strongly built bastions.

The two points to be carried were the convent and the bridgehead. The Mexican commander, Gen. Antonio López de Santa Anna, threw a battalion into the convent, placed five guns and a heavy body of troops at the bridgehead, and posted several regiments along the north bank of the stream. The first American assault was made on the convent when the brigades of Gen. Benney Riley and Gen. Persifor F. Smith attacked it from the west and south. Seizing a line of adobe buildings 60 yards from the convent, they opened fire under that protection and held it until the time for advance. Meantime the division of Gen. William Jenkins Worth, with the forces of Gen. Gideon Johnson Pillow and others, had charged down the causeway, blocked for several hundred yards with loaded wagons, and through the fields to the bridgehead. They were twice repulsed with tremendous loss by the plunging fire of the Mexican guns; but Gen. James Shields had moved north from Coyoacán and, after a fierce combat, which nearly overwhelmed him, he was reinforced by Capt. Robert E. Lee and Maj. Edwin Vose Sumner, carried the river line, and moved east against the rear of the bridge. In danger of having their retreat from the capital cut off, the Mexicans lost nerve, and a third charge from the Americans carried the bridgehead with a rush. Thence they turned southwest against the convent; the American artillery was still battering it on the other side; a sally from the garrison was driven back and, as the fire slackened, both divisions of the Americans entered it from opposite sides at the same time.

The American forces in this battle numbered a little over 7,300; the Mexican numbers are uncertain, but were probably about 25,000. The American losses at Contreras and Churubusco together were 1,053, over 100 at Contreras alone. Mexican casualties were 2,637 prisoners at both, and probably 2,000 at least killed and wounded at Churubusco. See also CONTRERAS, BATTLE OF.

M., *History of the Mexican War* (Washington 1892); Smith, Justin H., *The War with Mexico*, 2 vols. (New York 1919); Henry, R. S., *Story of the Mexican War* (Indianapolis 1950).

CHUSAN, China. See CHU SHAN.

CHUSOVOI or **CHUSOVOY**, chō-sō-voi', city, USSR, located in the Russian Soviet Federated Socialist Republic and the central Urals, on the 480-mile Chusovaya River, about 55 miles east-northeast of Molotov. A rail center, it has important heavy industries (steel and pig iron). The city was founded in 1879. Pop. (est. 1933) 41,620.

CHUTNEY, chūt'ni (from Hindustani *catni*), a condiment compounded of sweets and acids, much used in the East Indies and thence introduced into England and other countries. Ripe fruit, especially mango and tamarinds, raisins, spices, herbs, chilies or cayenne, lemon juice, and vinegar, are the ordinary components, which are pounded, well boiled together, and then bottled for use. It is often served with curried dishes.

CHUVASH AUTONOMOUS SOVIET SOCIALIST REPUBLIC, chō-vāsh', USSR, administrative division in the Russian Soviet Federated Socialist Republic, south of the Mari ASSR and in the mid-Volga Basin. Its capital is Cheboksary, a Volga port. The region is forested (largely oak), and timber industries furnish the most important products. Grain crops are extensive and the cultivation of kok-saghyz, a rubber-bearing plant, is gaining in prominence. Mineral resources include phosphorites. The climate is of the severe Continental type; the rivers are frozen during winter, and there is snow for five months of the year. The Chuvash, a Turkic-Tatar people, making up about 80 per cent of the entire population, are sometimes thought to be descendants of the ancient Bulgars. The republic was set up in 1925. It covers 7,100 square miles; pop. (est. 1941) 1,132,360.

CHUZZLEWIT, Martin, the principal character in Charles Dickens' novel *The Life and Adventures of Martin Chuzzlewit* which was originally published in monthly numbers from January 1843 to July 1844.

CHYLE, kil, a milky white emulsion of fat globules taken up by the lacteals from the intestines in the course of digestion. It resembles lymph, except in the fat content, and is alkaline in reaction. Chyle has a specific gravity of 1.0222 and contains on the average 6.8 per cent of solids, of which proteins constitute 3.64 per cent and fat 3 per cent, the remainder being made up of cholesterin, lecithin, and salts. Under some circumstances the fat content may be as high as 5 to 15 per cent. From the lacteals—lymphatic vessels in the small intestine—and deeper lymph channels, chyle is forced ultimately into the thoracic duct from where it is conveyed to the left subclavian and internal jugular veins. Thus chyle, with its nutritious elements, enters the blood stream and merges with it to nourish the body. See also CHYME; LACTEALS; and LYMPH.

CHYME, kim, the pulpy, semifluid contents of the stomach consisting of food which has undergone gastric digestion before passing into the duodenum. The mass is grayish in color and the previous texture or nature of the aliment can no longer be distinguished. It passes by the pylorus into the intestinal canal, where it is then mixed with the pancreatic juice and bile; parts of it are absorbed by the lacteals that transform it into chyle (q.v.). See also DIGESTION.

CIALDINI, chāl-dē'nē, Enrico, DUCA DI GAETA, Italian soldier and diplomat: b. Castelvetro, Modena, Italy, Aug. 10, 1811; d. Leghorn (Livorno), Italy, Sept. 8, 1892. For his share in the insurrection of 1831 he was forced to escape to France and in 1835, passing over to the Spanish service, he fought against the Carlists and was made colonel. In the Crimean War he commanded a division of the Sardinian contingent, and on his return was appointed aide-de-camp to the king. He was entrusted by Camillo Benso di Cavour, the Sardinian premier, with the forma-

tion of the famous army unit, Cacciatori delle Alpi. In the Italian War of 1859, the victory at Palestro was his chief exploit. In 1860 he defeated the papal army at Castelfidardo; and in 1861 Gaeta and Messina yielded to him. Created duke of Gaeta, and for a few months governor of Naples, he defeated Giuseppe Garibaldi at Aspromonte (1862) in the latter's attempt to secure Rome. In the war of 1866, he occupied Venice almost without a blow, but was defeated at Custoza. In 1876 he was sent as ambassador to Paris, but he retired in 1881 and received the post of one of the two generals of the Italian Army.

CIAMICIAN, chā-mê-chān', **Giacomo Luigi**, Italian chemist: b. Trieste (then in Austria), Aug. 22, 1857; d. Bologna, Italy, Jan. 2, 1922. Educated at the University of Vienna, he became assistant at the chemical institute of Rome in 1880 and in 1889 was appointed professor of general chemistry at Bologna. In 1910 he became a member of the Italian Senate. His latest studies were in the field of biological chemistry. His published works include *I problemi chimici del nuovo secolo* (1905); *Cooperazione delle scienze* (1911); and *Fotochimica nell'arvenire* (1912).

CIAMPI, chām'pē, **Ignazio**, Italian poet and historian: b. Rome, Italy, July 31, 1824; d. there, Jan. 21, 1880. From 1874 until his death he was professor of modern history in the University of Rome. His poetical works include an epic, *Stella* (1858), two volumes of *Poesie varie* (1857), and comedies, including *Il segretario e la contessa*. Ciampi wrote several works on the history of literature, also biographies, and histories of special periods. His principal work appeared posthumously: *Storia moderna dalla scoperta dell'America alla pace di Westfalia*, 2 vols. (1881-1883).

CIAMPI, **Sebastiano**, Italian scholar: b. Pistoia, Italy, Oct. 30, 1769; d. Florence, Dec. 14, 1847. Ordained as a priest in 1793, he was appointed professor at the University of Pisa in 1803; he accepted in 1818 a professorship at Warsaw and returned to Florence, Italy, in 1822, a prebend which enabled him to devote himself to literary studies having been conferred on him in Poland. His principal works treat of Italian literature and art, of ancient literature, of the Latin literature of the Middle Ages, and of the history of Poland.

CIANO, chā'nō, **CONTE Galeazzo** (in full, **CIANO DI CORTELLAZZO**), Italian foreign minister under Mussolini: b. Livorno, Italy, March 18, 1903; d. Verona, Jan. 11, 1944. With his father, Count Costanzo Ciano (1876-1939) he participated in the Fascist march on Rome in 1922. After law studies at the University of Rome, he engaged briefly in journalism, then in 1925 entered the diplomatic service, serving at Rio de Janeiro, Buenos Aires, and the Holy See. In 1930 he married Edda, oldest child of Mussolini, and was appointed consul general at Shanghai, later becoming minister to China. He returned to Italy in 1933 and the following year was made minister of press and propaganda. An enthusiastic amateur aviator, he commanded a bomber squadron in the war with Ethiopia (1935-1936). In June 1936, Mussolini appointed him foreign minister, although he was but 33 years old and

lacked both experience and temperamental aptitude for so important a post.

Ciano's relations with the Germans increasingly worsened during the period before Italy's declaration of war against France (June 1940); indeed, after the 1938 Anschluss he and von Ribbentrop were hardly on speaking terms, and he vainly attempted to prevent the signing of the Tripartite Treaty of May 1939 which bound Italy to the German juggernaut. On the eve of the war he commenced a diary which was published in a two-volume edition at Milan in 1946, after a translation had appeared in London (1945). This work reveals his humiliation at the arrogance shown by the Germans toward their Italian ally, and his futile attempts to prevent Mussolini from becoming still more subservient to Hitler. Relieved of his post on Feb. 5, 1943, he was made ambassador to the Holy See. In July he joined the dissident members of the Fascist Grand Council who forced Mussolini's resignation. Interned in Germany, he was delivered by the Germans to the Italian Fascists at Verona, tried by them for treason, and executed by a firing squad.

CIBAO, sê-vă'ô, valley, Dominican Republic, in the northern part of the country, forming its economically most important section and extending for about 150 miles east-southeast between the Cordillera Septentrional and the Cordillera Central. The latter range comprises the Cibao Mountains, which have a length of about 20 miles. In the Cibao are such towns as Monte Cristi (Montecristi), Santiago de los Caballeros, La Vega, and Sánchez. The fertile region produces tropical fruit, tobacco, coffee, cacao, sugarcane, and cereals. The valley's eastern portion is also called La Vega Real. When Columbus discovered the island, he was told by the natives that there was gold in the Cibao and he thought it to be a part of Marco Polo's Japan (Cipango).

CIBBER, sīb'ēr, or **CIBERT**, **Caius Gabriel**, Danish sculptor, father of Colley Cibber (q.v.): b. Flensburg, Denmark (now Schleswig-Holstein, Germany), 1630; d. London, England, 1700. Visiting England during the protectorate of Oliver Cromwell, he met with such encouragement as to induce him to settle there. The many works he was commissioned to execute include the bas-reliefs on the pedestal of the London Monument and ornaments for the gardens of Hampton Court. The sculptures, however, by which he is principally known are his figures of *Melancholy* and *Raving Madness*, formerly erected above the gate of the old Bethlehem Hospital and now in the Guildhall Museum.

Consult Faber, Harald, *Caius Gabriel Cibber* (New York 1926).

CIBBER, **Colley**, English dramatist and actor: b. London, England, Nov. 6, 1671; d. there, Dec. 12, 1757. A son of the Danish sculptor Caius Gabriel Cibber (q.v.), and the latter's second wife, Jane Colley, he made his appearance with Thomas Betterton's company at the Drury Lane Theatre in 1690. His first comedy, *Love's Last Shift, or the Fool in Fashion*, came out in 1696 and met with great success. He himself played the part of Sir Novelty Fashion, a fop. The character, also borrowed by Sir John Vanbrugh, is found in most of his plays, the roles of which he acted with similar distinction. Cibber's fame as dramatic author is founded chiefly on the

Careless Husband (1704), which even obtained the approbation of his declared enemy, Alexander Pope. This comedy, though without novelty in the characters and without invention in the plot, is a good picture of the manners and follies of the time. His play, the *Non-Juror*, an imitation of Molière's *Tartuffe*, adapted to English manners, was first performed in 1717 and was directed against the Jacobites. Though it was very successful, it made for him many enemies whose number he increased by his conduct as director of the Drury Lane Theatre, from 1711. His appointment as poet laureate in 1730 gave full play to the raillery of his enemies. Cibber, though not devoid of vanity, had the good sense to join in the laugh against his own verses. Pope, however, did not cease to ridicule him at every opportunity, particularly in *The Dunciad*. In 1740 Cibber published his *Apology for the Life of Mr. Colley Cibber, Comedian*, written with spirit and candor and containing many entertaining anecdotes and judicious remarks on the theater of that time.

Consult Habbema, D. M. E., *Appreciation of Colley Cibber*, . . . (Amsterdam 1928); Senior, F. D. P., *Life and Times of Colley Cibber* (New York 1928); and Barker, R. H., *Mr. Cibber of Drury Lane* (New York 1939).

CIBBER, Susannah Maria (Arne), English singer and actress: b. London, England, February 1714; d. there, Jan. 30, 1766. She was the sister of the celebrated Thomas Augustine Arne (composer of the music of *Rule Britannia*), who taught her music and introduced her in one of his operas at the Haymarket Theatre. She was a favorite of George Frederick Handel, who composed pieces expressly adapted to her voice and also instructed her in singing them. In 1734 she married Theophilus Cibber (q.v.), but soon after was separated from him. Subsequently she made her appearance in tragedy. Her beauty and her talent gained her universal admiration. David Garrick is said to have exclaimed, when informed of her death, "Then tragedy has expired with her." She is buried in Westminster Abbey.

CIBBER, Theophilus, English actor and dramatist, the son of Colley Cibber (q.v.): b. London, Nov. 26, 1703; d. at sea, October 1758. Educated at Winchester College, he was a friend of Richard Steele, in whose *Conscious Lover* he had his first part at the Drury Lane Theatre in 1721. Among his own plays are *The Lover* (1730); *Patie and Peggy; or, the Fair Foundling* (1730); and *The Auction* (1757). *An Account of the Lives of the Poets of Great Britain and Ireland* (1753), which appeared under his name, was largely from the pen of Robert Shiels, a Scotsman, who purchased for 10 guineas the right of prefixing to the work the name of Cibber, then in prison for debt. Cibber's second wife was Susannah Maria Cibber (q.v.), from whom he separated in 1738. When on his way to Dublin, his ship was lost and he was drowned off the coast of Scotland.

CIBOLA, sê-bô'lä, Seven Cities of, legendary towns reputed to possess great riches in gold and probably situated in what is today northern Mexico (Sonora) and the southwestern United States (southern Arizona). They were first reported by survivors of Pánfilo de Narváez' expedition to Florida (1528) and the name was used in 1539 by Fray Marcos de Niza (or da Nizza) for several Zuñi villages. Niza's somewhat fan-

tastic reports induced Francisco Vázquez Coronado to undertake his celebrated expedition in 1540. See also PUEBLO INDIANS; ZUÑI.

Consult Nizza, M. da, *Discovery of the Seven Cities of Cibola* (Santa Fe, N. Mex., 1926); Sauer, C. O., *Road to Cibola* (Berkeley, Calif., 1932)

CIBORIUM, si-bō'ri-ūm, the sacred vessel of silver, gold, or silver gilt, usually goblet shaped and covered, in which the sacred host is reserved. Its liturgical name is pyx.

In architecture ciborium is the name of the canopy which overhangs the high altar of a church.

CIBOTIUM, si-bō'ti-ūm, a genus of tropical and semitropical ferns, some of which are cultivated in greenhouses. *C. schidei* is one of the most graceful of the *Cibotium* tree ferns and is favored in large greenhouses. Another species, *C. barometz*, is presumed to have been the inspiration for the legendary Scythian or Tatarian lamb or barometz, a woolly, hoofed, half-creature and half-plant which was said to grow on a stalk attached to the navel and which fed in a circle, pivoting on the stalk. It was thought to fade and die when it had consumed the herbage within reach. The legend is attributed to this fern because of its golden woolly thick rhizomes that retain the old stalk bases, which resemble somewhat the legs of a quadruped. The "wool" has been utilized as a padding or stuffing material and also as a styptic. A starch has been extracted from the trunks of some species of *Cibotium*.

CIBRARIO, chē-brä'ryō, CONTE Giovanni Antonio Luigi, Italian statesman and historian: b. Turin, Italy, Feb. 23, 1802; d. Trebiolo, Oct. 1, 1870. After completing his studies in canon law, he soon distinguished himself by his historical investigations, pertaining particularly to the history of the house of Savoy. In 1848, when Italy rose against the Austrians, Charles Albert, king of Sardinia, appointed him senator of Sardinia. The same year Cibrario helped to bring about a union of Venice with Lombardy and Piedmont. He was made minister of finance in 1852 and in 1855 minister of foreign affairs. Among his published works are *Dell' economia politica del Medioevo* (1839); and *Storia di Torino* (1847).

CICADA, si-kā'dä, the name given to any member of the family Cicadidae, of the insect order Homoptera, which is considered by some to be a suborder of Hemiptera. The suborder Homoptera differs from the Hemiptera in that the wings are of uniform texture and are held roof-like over the abdomen when the insects are at rest. As compared with other insects, the cicadas are all of medium to large size, about one to three inches. They are characterized by having wholly membranous wings, three ocelli situated

Seventeen-year cicada.

on the front between the compound eyes, a long rostrum or sucking beak, and five- or six-segmented small bristlelike antennae, arising from a short basal segment. The front femora are enlarged and usually bear spines, which are used in the nymphal stage for tunneling through the ground; and the males, with few exceptions, have a well-developed tympanum or sound-producing organ on each side of the abdomen near the base. The species of the temperate zones are, as a rule, rather somber in color, but many of those found in the tropics have the wings brilliantly colored.

The larva or nymph of the cicada bears much less resemblance to the adult than do any other members of the orders Hemiptera or Homoptera. The nymphal stage is spent on the ground, the insects sucking sap from the roots of herbaceous or woody plants. The majority are found in forest areas, though many have adapted themselves to prairie or savanna areas where they feed upon the roots of broad-leaved plants. The eggs are laid in the twigs of trees or the stems of shrubs and plants. The ovipositor of the female is long and strong and reposes within lateral sheaths: with this she saws a long slit in a place suitable for oviposition and deposits her eggs, to the number of three to 15. The number varies according to the suitability of the spot selected; each female lays a total of from 50 to 150 eggs. The life cycle of cicadas varies from two to five years, depending upon the species, but in two forms it requires 13 and 15 years respectively.

The male cicadas, except for two species of *Tettigarcta* in Australia, all "sing" by rapid vibration of the tympanum. Each species has a different song and many so far undescribed species have been recognized by the sounds they make. For the most part, cicadas sing only during the hot portion of the day and only when the temperature is above 60°F. However, a few species will continue to sing after the sun sets if the moonlight is bright; others normally sing at night. The female is attracted to the male by his song, but once she alights near him, he forgets music and pays strict attention to her.

One of the largest species is the great Borneo cicada, *Pomponia imperatoria*, a night singer with a wing expanse of eight inches, used as food in Malaya. Other kinds are eaten in various parts of the world. The Chinese blistering cicada or Chu-ki, *Hucchys sanguinea*, with rich red and black coloration, is often found on *Ailanthus* (trees). The dog-day cicada or lyreman, *Tibicen linnei*, is a large green and black American species with a shrill, noisy song during the harvest season. Only a single species of more than 1,500 known kinds, *Cicadetta montana*, is found in Great Britain. A dozen species occur on the European continent. North America has more than 200 species but the family has its greatest representation in the tropics.

The most famous of all the cicadas is the 17-year locust, *Magicalcica septendecim*, first noted by American colonists in 1633 during an outbreak which covered the northeastern portion of the present United States. The broods are numbered from one to 17 and the area and time of the appearance have been carefully plotted. The most widely distributed and most abundant brood is No. X, which occurs over the whole range of the insect. Its most recent outbreak in the United States was in 1953. It will be present again in 1970 and again in 1987. The second largest brood is No. XIV, which will appear in 1957 and each

succeeding 17 years in most of the area where brood X occurs. In the southern half of the eastern United States there is a race of *M. septendecim* that requires only 13 years to reach maturity. See also GRASSHOPPERS AND LOCUST PLAGUES; LOCUST.

CHARLES H. CURRAN.

CICATRIZATION, sĭk-ă-trĭ-ză'shŭn, the healing process of the skin brought about by the formation of scar tissue. Springing from both sides of the wound, this new connective tissue—the cicatrix—appears as red or purplish in color when newly formed, and white and glistening when older. Tissue repair may be stimulated by injury to tissue cells caused by accident or inflicted intentionally as in operations. The damaged cells liberate fibrin with the coagulated blood plasma which furnishes the framework for subsequent skin growth.

CICER, sĭ'sēr, a genus of the pea family related to the vetches, peas, and beans. The genus numbers 15 species native to western Asia, and includes the chick-pea or garbanzo, *C. arietinum*, which is cultivated for the edible seeds in southern Europe, Asia, and the American tropics. See also CHICK-PEA.

CICERO, sĭs'ēr-ŏ, Marcus Tullius, Roman jurist, orator, author, statesman, and perhaps the greatest master of Latin prose style: b. Arpinum (modern Arpino), Latium, Italy, Jan. 3, 106 B.C.; d. Formiae (modern Formia), Latium, Dec. 7, 43 B.C. His father was a knight of good social position and the son was well educated in preparation for the bar and for public life. While still a young man he served in a campaign under Gnaeus Pompeius Strabo. He first appeared as a lawyer in 81 B.C. and again in 80, and in the latter case was brought into direct collision with a favorite of the dictator Lucius Cornelius Sulla. It was perhaps in consequence of this that he withdrew for a time from Rome and spent the years 79-77 in Greece and Asia Minor, occupying himself with the further study of oratory.

In 75 Cicero began his political career by serving as quaestor in Sicily, and in 70 he gave evidence of the closeness of his relation to that province by prosecuting Gaius Verres for maladministration as governor there. In 69 he was curule aedile and in 66 urban praetor, following the usual course of offices. In the latter year he made his first distinctively political speech in support of a proposal by the tribune Gaius Manilius to give to Gnaeus Pompeius Magnus (Pompey) the command of the war against Mithridates VI, king of Pontus. Though the distinction between parties was then less sharp than it is now, he had thus far been connected with the democratic party, but in the canvass for the consulship for 63 that party had already two candidates in the field. Cataline and Gaius Antonius, while the Optimates had no candidate of special promise. As Cataline belonged to the radical wing of the democrats, the senatorial party, desiring his defeat, threw its influence in Cicero's favor. He was thus elected as a representative of the Optimates and continued to act with that party during the rest of his life. His constitutional instincts were further strengthened by the outbreak during his consulship (63) of the so-called conspiracy of Cataline, an attempt by the radicals under the leadership of this reckless

noble to seize the government by violent means. This attempt Cicero suppressed with considerable vigor; Catiline was killed in battle and several of his associates were condemned to death by a vote of the Senate and executed under Cicero's orders. The execution, however, was of questionable legality, since it set aside the right of the accused to an appeal to the popular assembly, and Cicero was at once attacked by members of the democratic party for his responsibility in the transaction.

Upon the formation, in 60, of the coalition between Pompey, Gaius Julius Caesar, and Marcus Licinius Crassus, called the First Triumvirate, by which the democrats came into control of the government, Cicero was banished from Rome and left Italy (April 58). The years preceding his exile had been years of great professional activity and some of the best of his speeches belong to this period, but he had not yet acquired the habit of literary production and the year of his absence was unfruitful except in letters. His return to Italy in 57 was made the occasion of a great party demonstration and was to some degree a personal triumph, and he engaged himself at once in suits for the recovery of his property and in the party struggles with the Triumvirate. During this period he also resumed his early studies in rhetoric and wrote the *De Oratore*, one of his most finished and authoritative works.

Hitherto Cicero had not followed the usual custom of taking the proconsular governorship of a province, but in 51, in compliance with a new law, though much against his will, he went as governor to Cilicia. He spent here exactly the year required of him, from July 31, 51 to July 30, 50; but, impatient as he was of the enforced absence from Rome, his governorship was highly creditable to him; he showed, in particular, the most honorable scrupulousness in abstaining from even the customary exactions from the provincials.

When he returned to Rome, Cicero found all parties absorbed in the agitations which preceded the civil war. Early in 49 Caesar marched upon Rome and Pompey withdrew to Dyrrachium (now Durres, Albania). During these months Cicero remained away from the city in great uncertainty as to his duty and his interests. Caesar asked of him only that he should remain neutral, and his own forebodings as to the outcome of the struggle inclined him toward this course, but his party connections, his constitutional prejudices and opinions, and his lifelong respect for Pompey took him finally to the camp at Dyrrachium. After the victory of Caesar at Pharsalus in August 48, he returned to Italy and spent a year in Brundisium (now Brindisi), awaiting Caesar's permission to go to Rome.

From the summer of 47 to March 44 the domination of Caesar put an end to free discussion and action in the state and Cicero made only a few speeches, addressed to Caesar, with whom he had always been on terms of friendship, on behalf of persons desiring amnesty. But the enforced political inactivity he put to use in literature, and to this period belong almost all his greatest writings, the ripe fruits of a life of intellectual interests. In March 44 the assassination of Caesar aroused in Cicero, though he was not cognizant of the plot, a renewed hope that the Senate might recover control of the state. But for the first few months events turned against his party; popular feeling did not approve the

death of Caesar, Marcus Antonius (Mark Antony) was unexpectedly active and successful, and Cicero for a time thought of joining Marcus Junius Brutus and Gaius Cassius Longinus, the tyrannicides, in the east. As the confusion began to clear, however, and the old issue between constitutional government and the rule of a dictator took form, Cicero's indecision came to an end and he threw himself unreservedly into the contest of the Senate with Antony. The 14 *Philippics*, delivered between September 44 and March 43, are unmatched among his speeches. When Antony and Gaius Julius Caesar Octavianus (the later Augustus) were reconciled and formed with Marcus Aemilius Lepidus the Second Triumvirate, Cicero's name was placed upon the list of the proscribed, and he was killed at his villa near Formiae.

The literary work of Cicero is in amount much greater than the extant work of any other Latin writer and in value is perhaps second only to the verse of Virgil. It consists of orations, rhetorical works, philosophical essays, and collections of letters, and will be discussed in that order.

Of the orations we possess 57 in nearly complete form and the titles of some 80 more are known. The extant orations are about equally divided between speeches to the Senate or the people on public questions and legal pleas. Cicero spoke by preference on the side of the defense in both civil and criminal trials, sometimes making a close legal argument, but not infrequently using also political and even literary discussions to relieve the formal argument. The public orations are to a considerable extent invectives, especially the 4 orations against Catiline and the 14 *Philippics* against Antony, and these are at times bitter to a degree that modern taste would condemn, even in the most excited political struggles. But the wit, the fire, the humor and breadth, the easy handling of complex argument, and the perfection of stylistic form are such that no critic, either ancient or modern, has seriously questioned Cicero's supremacy in Roman oratory.

The rhetorical works deal chiefly with oratory; several are textbooks on the theory and practice of public speaking, one is a history of Roman oratory, and one is a discussion of the ideal in oratory. While Cicero did not attempt a wholly novel treatment of these subjects, there is in the works much of the ripe judgment of the practiced speaker who was interested also in the theory of his life work, and they contain some of his most finished and delightful writing.

The philosophical works are constitutional and ethical essays in dialogue form. Cicero himself regarded them as useful means of making educated Romans better acquainted with Greek philosophy, especially of the Academic and Stoic schools, and made for them no claim to originality of thought.

The uncertainty of the judgment of posterity was never better illustrated than in the history of opinion in regard to Cicero. During the earlier centuries after the Revival of Learning, the judgment which scholars formed in regard to Cicero's public career was really determined by their just admiration for his Latin style. But with the rise of historical science a revision of opinion was inevitable. This found expression in Wilhelm Drumann's *History of Rome* . . . and later in Theodor Mommsen's history; in both these writers the extravagant and passionate dis-

crediting of Cicero was as marked as the earlier unquestioning worship had been. However, half the discussion in regard to the character of Cicero is fundamentally an expression of opinion or feeling about the constitutional crises and political issues of his time. The severest critics of Cicero have been German scholars, eminent indeed, but accustomed to feudal traditions and inexperienced in the workings of a free constitution. The judgment of English scholars, though not unanimous, has been more liberal.

Cicero was, as most orators are, a man in whose temperament emotion and sensibility were more controlling than intellect or will. Such a man is always liable to the charge of inconsistency and his conduct is certain to show extremes of weakness and of strength. On three occasions, in the trial of Sextus Roscius Amerinus, in the affair with Catiline, and in the struggle with Antony, he showed the hot courage of attack, but in the trial of Titus Annius Papianus Milo he failed to exhibit the cool and steady courage required to face mob violence. At the outbreak of the civil war he hesitated long—not wholly without reason—and after the death of Caesar his vacillation amounted to weakness, but taken as a whole his public life was a consistent expression of his patriotic feeling.

EDWARD PARMELEE MORRIS.

Bibliography.—Among the better collections of Cicero's works may be mentioned those of Karl von Halm, with excellent notes and introductions (Leipzig 1845-46), and of C. F. W. Müller, without commentary (Leipzig 1880-96). Consult also Forsyth, William, *Life of Marcus Tullius Cicero* (London 1864); Tyrrell, R. Y., *Correspondence of Marcus Tullius Cicero* (London 1865); Trollope, Anthony, *Life of Cicero* (London 1880); Boissier, Gaston, *Cicéron et ses amis*, 10th ed. (Paris 1895); Sihler, E. G., *Cicero of Arpinum*, 2d ed. (New Haven 1915); Petersson, Torsten, *Cicero* (Berkeley 1920); Strachan-Davidson, J. L., *Cicero and the Fall of the Roman Republic*, new ed. (London 1929); Ciaceri, Emanuele, *Cicerone e i suoi tempi*, 2 vols. (Milan 1939-41); Haskell, H. J., *This Was Cicero* (New York 1942); Wilkin, R. N., *Eternal Lawyer, a Legal Biography of Cicero* (New York 1947); and Crowell, F. R., *Cicero and the Roman Republic* (London 1948).

CICERO'S LETTERS

The letters, *Epistulae*, of Cicero cover a period of 25 years, from 68 to 43 B.C., the year of the orator's death, and are embraced in four groups:

(1) *Epistulae ad Familiares*, consisting of 16 books of letters to various friends, including an entire book of those addressed to his wife and children, and another book of those to his faithful freedman Marcus Tullius Tiro.

(2) *Epistulae ad Atticum*, likewise consisting of 16 books, a witness to the lifelong friendship and intimate relations subsisting between Cicero and Titus Pomponius Atticus.

(3) *Epistulae ad Quintum Fratrem*, three books of letters to Cicero's brother Quintus Tullius.

(4) *Epistulae ad Marcum Brutum*, two books of letters to the Brutus who headed the conspiracy against Julius Caesar.

The contents of the letters are so various that it is difficult in brief compass to give any adequate conception of their range and quality. Many of them deal directly with the stirring political issues of Cicero's own time, the strife of parties, the competition for office, the ambitious aspirations of Caesar, Pompey, and Crassus in the First Triumvirate, the struggle between Caesar and Pompey and the chaotic conditions subsequent to Caesar's assassination. Others have to do with the purely personal affairs of the writer, the publication of his works, the construc-

tion and furnishing of his villas, or the gossip of the day. Several touch upon the domestic infelicities of Quintus Tullius Cicero and his wife, Pomponia, the sister of Atticus, in which Atticus naturally blamed Quintus, while Cicero blamed Pomponia.

Most of the letters are written in the more intimate style of the Roman *sermo familiaris*, contrasting strongly with the studied elegance of the formal style characteristic of Cicero's other works. Equally marked is the unreserved frankness with which Cicero discusses the men and measures of his day. In the letters to Atticus, in particular, he practices as little reserve as if he were writing a diary for his own private edification. As a result, some of the less attractive features of Cicero's personality are brought out in strong relief. In 65 B.C. we find him writing to Atticus that he contemplates the defense of the unsavory Catiline. "I am thinking," he says, "of defending Catiline. We can have any jury we wish with the full consent of the prosecutor. If Catiline is acquitted, I hope it will make us better friends." Thus he writes of the man whose true character he knew well, and whom only two years later he was branding in his speeches with all the vituperation at his command.

The four collections above enumerated contain about 925 letters written by Cicero. As many more are believed on good grounds to have existed in antiquity and to have been lost. Incorporated in the *Epistulae ad Familiares* and the *Epistulae ad Atticum* are some 125 letters written by Cicero's correspondents. Thus we have an entire book of letters from Marcus Caelius Rufus. Others from whom letters are preserved are Lucius Munatius Plancus, Cato the Younger, Pompey the Great, Gaius Cassius Longinus, Marcus Aemilius Lepidus, and Gaius Asinius Pollio. One of the most notable letters is from Caesar, written in reply to one of Cicero. Cicero had praised the dictator for his magnanimity in sparing the lives of his opponents who had surrendered at Corfinium. Caesar's reply breathes the same generous spirit which had prompted his act of clemency.

In their range, their sincerity, their connection with the events of the time, and their intensely human quality, the *Letters* are not only of commanding interest, but they are of the greatest value in helping us to understand the complex character of the orator and the tangled events of his day. In modern times the first manuscript of the *Letters* was discovered by Petrarch in the 14th century. The great humanist was shocked at the new light thrown by them on Cicero's character and composed his famous letter to Cicero.

Bibliography.—There is an excellent translation of all the letters by E. S. Shuckburgh, 4 vols. (London 1899-1900); also of the *Letters to Atticus* by E. O. Winstedt, 3 vols. (London 1918-21), and of the *Letters to His Friends* by W. G. Williams, 3 vols. (London 1927-29).

CHARLES E. BENNETT,
Revised in the "Encyclopaedia Americana" Editorial Office.

CICERO, Marcus Tullius, Roman administrator and politician, only son of Marcus Tullius Cicero (q.v.), the orator, and of Terentia: b. Rome, Italy, 65 B.C.; d. after 28 B.C. After accompanying his father to Cilicia (51 B.C.), he served during the civil war with Gnaeus Pompeius Magnus (Pompey the Great) in Greece,

where, despite his young age, he probably had a command at the Battle of Pharsalus (48 B.C.). Sent to Athens to study, he inclined toward dissipation and indolence. Upon Gaius Julius Caesar's murder (44 B.C.) he sided with Marcus Junius Brutus, but joined Sextus Pompeius after the Battle of Philippi (42 B.C.). Returning to Rome, he was pardoned by Gaius Octavianus (Augustus), who shared the consulship with him in 30 B.C. Later he served as proconsul in Asia during 29–28 B.C.

CICERO, Quintus Tullius, Roman general and younger brother of Marcus Tullius Cicero (q.v.), the orator: b. Arpinum (Arpino), Italy, about 102 B.C.; d. December 43 B.C. Educated with his brother, he had little taste for oratory, though he seems to have shown some literary ability; but there is virtually nothing left of his works. His marriage to Pomponia, the sister of Atticus, which was arranged by Marcus, was unhappy. After serving as aedile (65 B.C.) and as praetor (62 B.C.), he left mainly a mark as a military leader. He saw combat in Gaul and in Cilicia. In the civil war he initially supported Pompey, but later joined Gaius Julius Caesar. Like his brother, he was proscribed by the Second Triumvirate and was slain with his son Quintus Tullius.

CICERO, Quintus Tullius, son of Quintus Tullius Cicero (q.v.): b. 67 B.C.; d. December 43 B.C. His uncle Marcus Tullius Cicero supervised his education and took him to Cilicia (51 B.C.). After Gaius Julius Caesar's assassination (44 B.C.), he sided with Marcus Antonius (Anthony), but later turned to Marcus Junius Brutus. He, too, was proscribed by the Second Triumvirate and executed with his father.

CICERO, sis'ēr-ō, town, Illinois, in Cook County; altitude 610 feet; contiguous in the north and east to Chicago, of which it is the largest suburb, though an economic center in its own right. It is served by the Baltimore and Ohio, and the Chicago, Burlington and Quincy railroads. Cicero, site of the main plant of the General Electric Company, is an important manufacturing center, producing telephone, radio, and electrical equipment, castings and forgings, pumps, printing machinery, engravers' supplies, rubber products, and home appliances.

The town originally consisted of a few families living in the swampland, probably as early as 1833; it was incorporated in 1867 and received a charter in 1869. As Chicago prospered and gradually absorbed parts of Cicero, industry brought new population to balance the losses. Former sections of the town, Berwyn and Oak Park (qq.v.), were set up as separate communities in 1901. During prohibition in the 1920's, Cicero became the domain of Al Capone, who organized here his brewing and gambling enterprises until indicted in 1931. Cicero is the seat of Morton Junior College and is governed by a mayor and council. Pop. (1950) 67,544.

CICERONE, chē-chē-rō'nā, an Italian name for a guide who conducts visitors or tourists to places of interest, particularly antiquities. The eloquence of the cicerone was likened to Cicero, the Roman orator. Later, cicerone also came to designate historic travel books, among the most notable of these being the *Cicerone* by

Jakob Burckhardt, describing the art treasures of Italy.

CICHLID, sīk'lid, any of about 600 species of freshwater fishes of the family Cichlidae, order Chromides. They are found from Texas to northern South America, in a few islands of the West Indies, throughout Africa, where the greatest number of species occur, and two species are found in southern India and Ceylon. Some species have a tolerance for brackish and even salt water for varying periods of time. The order is distinguished by possession of one nostril on each side, as compared with two for other spiny-rayed fishes.

Cichlids are usually less than one foot long, but a few species reach two feet. About 100 species are used as aquarium fishes and several species have become semidomesticated. The members of this family practice highly specialized parental care, in which usually both parents take part. See also **TILAPIA**.

C. W. COATES.

CICISBEO, chē-chēz-bā'ō, or **CAVALIERE SERVENTE**, a name given since the 17th century in Italy to the professed gallant of a married lady. It was the fashion among the higher ranks in Italy for the husband, from the day of marriage, to associate with his wife in his own house only. In society or places of public amusement she was accompanied by the cicisbeo, who even attended at her toilet, to receive her commands for the day. The custom gradually disappeared in the 19th century.

CICOGNARA, chē-kō-nyā'rā, **CONTE Leopoldo**, Italian antiquarian, diplomat, and art historian: b. Ferrara, Italy, Nov. 17, 1767; d. Venice, March 5, 1834. He studied at Modena and Rome, and was later appointed ambassador to Turin and counselor of state. In 1808 he became president of the Academy of Fine Arts in Venice. His most important work is the *Storia della scultura dal suo risorgimento in Italia fino al secolo di Canova* . . . , 3 vols. (1813–1818). Cicognara also wrote an autobiography, published posthumously in 1888.

CICONIIFORMES, sī-kō-nī-i-fōr'mēz, or **HERODIONES**, an order of wading birds containing the following families: Ciconiidae, or storks; Threskiornithidae, or ibises and spoonbills; Scopidae, or hammerhead storks; and Ardeidae, or herons and egrets. All of these birds are long-legged wading forms. The flamingos, family Phoenicopteridae, are also placed in this order by some authorities. See also **STORKS**.

CICUTA, sī-kū'tā, a genus of poisonous plants commonly known as water hemlock and related to *Conium maculatum*, or poison hemlock. Both genera belong to the parsley family (Umbelliferae). The eight species of *Cicuta* occur in marshy places or along streams throughout the northern temperate zone. They are perennial herbs with white tuberous fleshy roots, pinnately compound leaves, and small white flowers borne in compound umbels. The important North American species are *Cicuta maculata* (variously known as musquashroot, beaver poison, spotted cowbane) which ranges from Quebec and Manitoba to Maryland and Texas; *C. bulbifera* in the eastern United States and Canada north to New-

foundland; and *C. vagans* and *C. douglasii* in the western United States. The plants are deadly poison. This fact is implied by the very name *Cicuta*, the Latin name for the hemlock which the Greeks may have given to criminals as a death potion; though the symptoms of poisoning in Plato's description of Socrates' death (in *Phaedo*) seem to point to *Conium maculatum* (poison hemlock). Cattle have reportedly died from browsing on the herbage and persons are known to have been poisoned from eating the roots. The poisonous principle, a resin-like substance (*cicutoxin*) soluble in alcohol, is dispersed through the whole plant but is most concentrated in the roots. Treatment of patients poisoned by this agent involves evacuation and stimulation of the stomach. See also HEMLOCK, POISON.

VERNE GRANT.

CID, The, *síd* (Span. *EL CID CAMPEADOR*, the Lord Champion; Arab. *SAYID*; real name RODRIGO (or RUY) DÍAZ DE RIVAR), Spanish soldier and national hero: b. Bivar or Vivar, near Burgos, Spain, about 1040; d. Valencia, 1099. Legend and tradition have somewhat obscured the character of the historical Cid, but the main facts of his life are well established by Spanish and Arabic records. He first appears in national history when Sancho II, eldest son of Ferdinand I and king of Castile, was at war with his brother, Alfonso VI of León. In this war the Cid commanded the victorious forces of Sancho. Alfonso was taken prisoner, and it remained only to overcome the obstinate resistance of Zamora, where Sancho's sister, Urraca, ruled. Before the walls of this city Sancho was assassinated, and Alfonso VI (Alfonso el Bravo) was called to the throne of Castile.

It is asserted that before recognizing Alfonso's authority the Castilian nobles required of him an oath that he had had no part in his brother's murder, and that it was the Cid who administered this oath, in 1073. Alfonso gave his cousin Ximena (Jimena), daughter of the count of Oviedo, to the Cid in marriage. The marriage contract, dated 1074, is preserved at Burgos. Later the king, taking advantage of a pretext that the Cid had attacked the Moors without obtaining the royal consent, banished him (1081). Thence began that career of "soldier of fortune," which, idealized by tradition, has made the Cid the perfect cavalier of Spain.

He first offered his services to the Christian count of Barcelona, and when refused by him, to the Moorish king of Saragossa, who accepted the offer. The Cid remained in Saragossa until 1088, fighting against Moors and Christians alike, and rising to unusual distinction and power. In 1088 the attention of Mostain, the king of Saragossa, was drawn to the city of Valencia, then under the protection of Alfonso. The Almoravides, a new Moslem sect from northern Africa, defeated Alfonso in battle, and caused him to withdraw his protection from Valencia, and the governor of the city appealed to Saragossa for help. The Cid was sent to the aid of Valencia which he eventually secured for himself in 1094. He successfully held the city until 1099, when the troops he had sent against the Almoravides were utterly routed, few escaping. The Cid, already enfeebled in health, died, it is said, of grief and shame. His widow held Valencia for two years longer. He left two daughters, one of whom married the count of Barcelona, and

the other the infante of Navarre. The Cid is now buried at the cathedral of Burgos.

In somewhat romanticized versions, the Cid and his exploits became favorite literary themes. He stood as the prototype of the noble, generous Castilian, of the doughty champion of Christendom, and as such he appeared in innumerable popular songs and ballads and in the first and greatest epic poem of Spanish literature, the *Poema del Cid*, or *Cantar de Mio Cid*. The poem reflects in a deeply emotional and human way the daily life, customs, and ideas of the times. Written about 1140, the poem was preserved in a copy made in 1307 by Per Abbat. The modern Spanish scholar Ramón Menéndez Pidal has elucidated most exhaustively the poem and its background.

Another poem of about the same time, *El Rodrigo, o las Mocedades del Cid*, is of inferior merit, though not without fine passages. Two centuries and more after these poems we meet with the *Romances* or *Ballads of the Cid*. These ballads depict Ximena Gómez as the wife of the Cid and tell the legendary story of her father, Don Gómez, insulting the Cid's father; of the ensuing revenge of the Cid by killing Don Gómez; of Ximena's pursuit of the Cid demanding justice of King Ferdinand; and the final reconciliation through marriage. (See also ROMANCERO DEL CID.)

Guillén de Castro y Bellvis, in his drama *Las mocedades del Cid* (*The Youth of the Cid*, c.1612-1613), drew his material from the ballads, but added love and the conflict between affection and the claims of honor in the mind of both Ximena and the Cid. Pierre Corneille based his famous drama *The Cid* (see *Cid, The*) upon that of Castro, using the same plot and the same struggle between love and duty. Corneille's play inspired the opera of the same name by Jules Massenet. There are several English translations of these ballads.

Bibliography.—Southey, Robert, *Chronicle of the Cid* (London 1808); Huber, V. A., *Geschichte des Cid* (Bremen 1829); Menéndez Pidal, R., *Cantar de mio Cid: texto, gramática y vocabulario*, 3 vols. (Madrid 1908-11); ib., *The Spain of the Cid* (London 1947).

CID, The (*LE CID*), the play through which Pierre Corneille first (1636) gained distinction as a dramatist, marks a turning point in the development of the French state. The scene is Seville, at the court of Ferdinand, king of Castile; the time about 1075; the theme, a struggle between love and honor. The kernel of the story, telling the early deeds of the Spanish national hero the Cid (see *CID, THE*), belongs to historic tradition and was borrowed by Corneille from the chronicles of Juan de Mariana, the Spanish ballads, and the drama of the Spaniard Guillén de Castro y Bellvis. Condensing de Castro's play, Corneille gave it dramatic unity and added greater dignity and nobility to the verse.

The play was popular from the first, even though the Academicians professed alarm; Cardinal Richelieu was jealous, for he had literary foibles, and Corneille found it prudent to withdraw for three years from Paris to Rouen. Nicolas Boileau, however, testified that "all Paris has for Rodrigue (the Cid) the eyes of Chinène," and, while this romantic drama lacks ethical depth and tragic force, it is still the most acted of Corneille's plays.

Bibliography.—*Le Cid* is best edited with English notes by C. Searles (Boston 1912). Concerning contro-

versies over the play consult: Gasté, A., *La Querelle du Cid* (Paris 1878) and Searles, C., *Les Sentiments de l'Académie Française sur Le Cid* (Minneapolis 1916).

CIDER, sī'dēr, a beverage made from the juice of apples. In Europe the term generally means a beverage made from fermented apple juice. But in the United States, unless specifically qualified as "hard" cider, it is made of unfermented apple juice. "Sweet" cider is the traditional New England and American drink, normally reaching its height in consumption during the autumn months. In France, in Normandy and Brittany, a fermented and aged cider is the native "wine" of those districts. In England, cider rivals beer in popularity in the counties of the southern and western sections of the country. Cider is also a popular beverage in Germany, Spain, and Switzerland.

In the United States and Canada, homemade cider is usually not processed, and has a sweet flavor, differing only slightly in taste from pure apple juice. It tends, however, to be a little heartier to the taste. But if put in a warm place, unrefrigerated, or neglected for too long a time, it crosses the line of fermentation and becomes sharp and vinegary to the taste. A patent was issued as early as 1862 in the United States, on canned and concentrated apple cider, but techniques have made great changes since then. The modern commercial product known as cider has a uniform flavor, though the characteristic taste of different brands may vary according to the types of apples used. The maturation and weather conditions of the year of manufacture may also be reflected in the taste. Commercial cider is pasteurized in order that its preservatives—sugar, malic acid, and tannin—are evenly distributed and uniform flavor is maintained. The formulas commercially used are carefully guarded secrets of the competing firms. Generally, of course, similar processes are followed: selected apples (the whole fruit) are grated in a mill, juice is extracted by means of a press, preservatives are added, and bottling completes the process.

Processing plants go into top speed early in September, as the apples ripen. Thousands of women seasonal workers join the permanent plant employees in handling the apple harvest. Trucks bring the apples into the plant yards. Next, the fruit is floated down watery troughs to be spray-washed before it is moved onto conveyor belts for preliminary inspection. The characteristics of a good cider apple are a red skin, tough and fibrous pulp, astringency, a certain dryness, and the specific gravity of its unfermented juice, or its weight as compared with that of an equal amount of water. This latter comparison is a fairly accurate indication of the strength of the future cider. Apple weight, and consequent value for this purpose, increase according to the ratio of the increase of saccharine matter. The United States Department of Agriculture has stated that much of the most highly favored apple cider has been produced from fruit growing on a shallow loam upon a limestone base. It would seem desirable that calcareous earth should be a part of the soil of a cider orchard, preferably dry and somewhat loose in structure. Cider apples should be plucked at the height of their maturity, before decay sets in. The fruit should remain on the tree until late, just short of actual frost. When harvested, some processors prefer to store the fruit in a cool, shaded room to attain further ripening during

which the apples acquire more saccharine matter while losing a considerable percentage of watery juice. The grinding operation proceeds best under conditions of cold which retard rapid fermentation. The whole fruit is reduced to a mass, then exposed to air for a short time to absorb oxygen. The mass is subjected to power pressure again, and the cider runs off into casks. In the year 1939, the United States Department of Commerce figures showed a production of 12,618,000 gallons of undifferentiated cider and vinegar stock, worth \$1,617,000. By 1947, when cider manufacture was separately listed, production totaled 11,629,000 gallons of cider, valued at \$3,262,000. No figures have been released since that date.

The degree of fermentation of apple juices in commercial processing is now highly controlled and can be initiated or halted at desired times. Through these controls and further distillation processes other cider products are obtained. A strongly fermented cider produced by distillation is called cider brandy or applejack, historically a "hard" beverage of pioneer days. This contains a large percentage of alcohol. Another variation of the manufacturing process turns cider into a species of vinegar. See also VINEGAR.

CIEGO DE AVILA, syā'gō thā ä'vê-lā, city, Cuba, located in Camagüey Province, on the Central Highway and the main line railroad, about 65 miles west-northwest of Camagüey and 15 miles from its Caribbean port, Júcaro. A transport and trading center for a fertile region producing sugarcane, tropical fruit, and cattle, it has various processing industries. In the war of independence (1895-1898) Cuban patriots pierced the Spanish defense line outside Ciego de Ávila. Pop. (1943) 23,802.

CIENAGA, syā'nā-gā, city and Caribbean port, Colombia, in Magdalena Department and on the Ciénaga (swamp) Grande, about 35 miles east of Barranquilla. It is linked by rail with Santa Marta, 17 miles south. Serving a productive agricultural region that yields mainly cacao, bananas, cotton, and tobacco, it also has important fisheries. Pop. (1938) 22,783.

CIENFUEGOS, thyān-fwā'gōs, **Nicasio Alvarez de**, Spanish poet and playwright: b. Madrid, Spain, Dec. 14, 1764; d. Orthez, Basses-Pyrénées, France, June 30, 1809. While studying at the University of Salamanca (1782-1787), he counted among his friends José Cadalso and Juan Meléndez Valdes, leading 18th-century poets. With them he founded the Salamancan school of poetry. The presentation of his tragedies *Zoraida* and *La Condesa de Castilla* won him recognition as a dramatist, and after the publication of his poems in 1798, he was appointed editor of the government publications *La Gaceta* and *El Mercurio* and, later, first secretary in the Department of Foreign Affairs. Though an admirer of French culture and of Napoleon, he sided in May 1808 with the Spanish patriots against the French invaders, and was brought to trial and condemned to death. However, the sentence was commuted to banishment to France. In addition to the plays mentioned above, he wrote *Idomeneo*, *Pitaco*, and *Las hermanas generosas*, and numerous poems, anticipatory of the Spanish romantic movement. His collected poems, *Obras poéticas*, were published in 1816 by order of the king.

CIENFUEGOS, syân-fivâ'gô's, Cuba, municipality and town in the province of Las Villas, on the south side of the island. Its harbor, which is one of the finest in the West Indies, was visited by Columbus on his first voyage, and was surveyed by Florián de Ocampo in 1508. The town was settled by refugees from Santo Domingo in 1819. Here the revolutionist Narciso Lopez planned to make his first demonstration on July 4, 1847. (See also CUBA.) In recent years its commercial progress has been rapid, and it is now the second seaport of Cuba. Some of the sugar estates in the neighborhood are very large, and conducted on the most approved modern plan; in fact, Cienfuegos is the center of the sugar trade on the Caribbean coast. It is a city of attractive, well-shaded streets, and substantially built houses. One of its plazas is the largest in Cuba. Among the principal buildings are the governor's house, market, railroad station and military and government hospitals. Water from the aqueduct is supplied to 42 per cent of the dwellings; from wells, to 47 per cent; from cisterns, to 7 per cent. There are social clubs, and a theater. The city is lighted by gas and electricity. The climate from May to November cannot be highly commended, the air having an excess of moisture, and the temperature ranging from 75° to 98°F. The winter months, however, are very agreeable. Prevailing winds are from the north and the temperature ranges from 60° to 78°F. during the day, with cooler nights. Cienfuegos is connected by rail with Sagua la Grande, on the opposite coast; with Santa Clara, the western terminus of the Cuba Company's main line to Santiago; with Havana, etc. By steamer it is in regular communication with New York, as well as with ports of the southern coast of Cuba from Santiago to Batabano. Pop. (1943 est.) municipality 94,810; town 52,910.

CIEZA, thyä'thâ, Spain, commune in the province of Murcia, and 26 miles northwest of the city of Murcia, on an eminence near the right bank of the Segura. It has spacious streets, a large church and ancient tower, manufactures of linen and hempen fabrics, and a trade in corn, wine, oil and silk. Pop. (1941 est.) 23,499.

CIGAR. A cigar is a roll of tobacco suitably formed for smoking. It is composed of a "bunch" of filler leaves, held together by a binder leaf, around which a wrapper leaf is rolled in a spiral manner and carefully finished. The mouth or head end is sealed with the wrapper, which is especially cut to form the closed end. The wrapper leaf is of fine silky texture, of selected colors, with a desirable taste and good burning qualities. The filler may be a long filler extending the full length of the cigar, or it may be composed of short pieces formed into a bunch by a suitable roller.

A number of varieties of tobacco make up the "cigar types" (see TOBACCO). They possess characteristic properties of taste, aroma, burning qualities, leaf texture and other factors that are inherent in the genetic structure of the plant. The properties are modified by the soil and climate in which the plant is grown, methods of curing, and most important by a unique process of fermentation that distinguishes cigar tobaccos from those other varieties generally used for cigarettes and pipe smoking.

History.—Cigar smoking was observed on the island of Cuba by the first expedition of Christopher Columbus, in November 1492. It was popularized by sailors and explorers returning from expeditions to the Caribbean islands and South America. The Spanish in 1698 established a monopoly in Cuba. They also introduced tobacco culture and cigar manufacturing in the Philippine Islands, and for many years they dominated the cigar trade of the world. Cigar tobacco production became important in Mexico and several of the Spanish and Portuguese colonies in South America. It was later introduced into Germany, Switzerland, and the Low countries.

A cigar factory was established in Hamburg, Germany, in 1788, and cigars came into general use in Germany by 1793. The first factory in the United States was established at Suffield, Connecticut, in 1812. The Peninsular War introduced the cigar to the French and English soldiers. After peace was declared in 1815 cigars were allowed entry into England from Spain. They became, however, a luxury item on account of high import duties. The influx of immigrants into the United States during the middle 19th century brought a number of cigar makers from Germany, who set up small factories throughout the northern states, and gave impetus to the industry in the United States. This group of skilled Europeans modified the type of cigar from the Spanish or Cuban by blending with the large "seed-leaf" types grown in the Connecticut Valley. Between 1840 and 1875 cigar leaf production was established in Florida, New York, Ohio, Wisconsin, and Pennsylvania, thereby making available tobaccos of various qualities, and thus developing a cigar consisting of a blend of domestic tobaccos.

The principal types of tobacco now used in the United States for making cigars are the following: wrapper leaf of fine texture and color, with good taste, is produced under cloth shade in the Connecticut Valley, Florida, Georgia and Cuba. A wrapper leaf of excellent quality is produced in Sumatra. Binder leaves are grown in the Connecticut Valley, Wisconsin and Pennsylvania. The principal fillers are produced in Pennsylvania, Ohio, New York, Cuba, and Puerto Rico. One-sucker and tip grades of Maryland (both usually classified as types of chewing and smoking tobaccos) are sometimes used as part of a short-filler blend in the cheaper cigars.

Classification.—Cigars are classified by the trade according to the blend of leaf as: (1) clear Havana, (2) seed and Havana, and (3) seed. Because of the wide range of possible blends of tobacco of the various types no hard or fast rule can be made for the two latter classes. A clear Havana cigar is one made entirely of tobacco grown in Cuba, and is the world's standard of excellence. Seed-and-Havana refers to cigars in which the filler is of Cuban tobacco, with a domestic binder leaf, like Wisconsin, and the wrapper of domestic shade-grown or Sumatra leaf. Puerto Rican tobacco may be used as part of the filler along with the Cuban. A Seed cigar is one in which the filler may be of Ohio, Pennsylvania or New York tobaccos, with a Wisconsin or Connecticut binder, and a Sumatra or shade-grown wrapper. This type of blend is used in a large portion of the cigars made in the United States. Modifications may include a con-

siderable portion of Puerto Rican tobacco in the filler.

A stogie is a pencil-shaped cigar, made without a binder leaf. It usually uses Ohio or Pennsylvania filler, and a Connecticut wrapper. It derived its name from the Conestoga peddler wagons traveling the Cumberland Turnpike through Pennsylvania, Maryland, West Virginia and Ohio. "Conestoga cigars" were an important commodity between 1850 and 1910.

The Italian cheroot is made from heavily fermented fire-cured tobacco grown in Kentucky, Tennessee, and Virginia. The long filler leaves are rolled in a wrapper well impregnated with rice flour paste which securely seals the wrapper. After rolling the cheroots are trimmed off squarely at each end which is left open. They are slowly dried to a low moisture content. They are slightly larger than a pencil, and are cut in half before smoking. They are strong, aromatic and flavorful, and popular among smokers of Italian descent.

A cigarillo is a small cigar, of pencil thickness and four to five inches long, and usually is well and carefully formed.

A "little cigar" is about the size of the average cigarette, with a tobacco wrapper and a shredded filler of cigar tobacco.

Manufacture.—The manufacture of cigars in the United States has become highly mechanized since the introduction in 1917 of the first successful machine capable of making a complete cigar. Production has become concentrated into large manufacturing units. The skilled hand roller, who for hundreds of years prided himself upon his craftsmanship, has been relegated to the scattered small shops, and to a number of the old-line quality shops in Tampa, Florida, which have held out against mechanization. In Havana, Cuba, trade unions with government cooperation held out for many years against the cigar machine. Only since 1949 have they permitted their use. In 1917 there were 14,576 cigar factories in the United States none of which was mechanized in the modern sense, and all employing hand rollers. In 1948 the United States Internal Revenue Bureau reported 2,402 manufacturing units; 2,040 employing hand rollers produced 1.61 per cent, whereas 112 machine equipped units produced 92 per cent of the cigars manufactured.

Mechanization came slowly to the cigar industry. Many years of experimentation were required to produce a machine that now quite satisfactorily performs all of the operations of the deft hand roller. The standard long-filler machine requires three operators and an inspector. The first operator places the long filler leaves into a trough with a continuous feeding mechanism. The leaf is cut to proper length and fed against another knife which cuts out the quantity to form the bunch of proper amount and density. A second operator lays a binder leaf on a die plate equipped with small holes and suction to hold the leaf in place. A roller cuts the leaf to shape. An ingenious transfer arrangement transfers the cut binder to an apron where it is rolled around the charge of filler to form the bunch. This is then placed in a viselike tool the jaws of which are formed to the shape of the cigar, and the bunch is pressed to proper shape. A third operator places the wrapper leaf on a suction die plate, where it is cut to shape, and transferred to a position where it can be spiralled around the bunch, the head end pasted,

and the finished cigar is rolled to smooth irregularities in wrapping, and delivered to an inspector. Three operators can produce about 800 long filler cigars per hour. A machine designed for short filler cigars and only employing two operators to lay the binder and wrapper leaves can produce 13 cigars per minute.

From the machine the cigars are packed in bundles, usually of 50 cigars, and stored in a conditioning room for several days to equalize the moisture to about 16 per cent. They are temporarily packed in boxes to shape them, and then delivered to the cellophane wrapping machine where each cigar is jacketed and sealed, and packed for sale.

Consumption and Distribution.—The annual per capita consumption of cigars in the United States is about 39 cigars. The total United States production in 1949 reported by the Bureau of Internal Revenue was 5,769,868,000 "large" cigars, weighing more than three pounds per thousand. Cigars are taxed under the Internal Revenue Act of 1942 on the basis of their retail sale price, as follows: Class A (to retail at 2½ cents or less) at \$2.50 per thousand; B (2½ to 4 cents) at \$3.00; C (4 to 6 cents) at \$4.00; D (6 to 8 cents) at \$7.00; E (8 to 15 cents) at \$10.00; F (15 to 20 cents) at \$15.00; G (more than 20 cents) at \$20.00.

In 1949 the distribution of the 7 classes was as follows: Class A, 11,737,000 cigars; B, 298,841,000; C, 1,556,818,000; D, 581,231,000; E, 3,020,907,000; F, 160,458,000; G, 139,876,000.

"Small" cigars (weighing less than three pounds per thousand) are taxed at the rate of 75 cents per thousand; 90 millions of small cigars were produced in 1949.

Cigar factories are located in 45 states. Pennsylvania leads in production with 43 per cent of the domestic output, and 363 factories distributed over the state. Florida ranks second with 18 per cent of the output, and large manufacturing units at Jacksonville, Tampa and Quincy. New Jersey is third. Other important states include Ohio, Virginia, South Carolina, New York, Georgia, Kentucky, Indiana, Louisiana, Massachusetts, New Hampshire, West Virginia and Tennessee.

In 1949 the United States imported from Cuba 11,134,000 cigars, and produced in bonded factories, from Cuban tobacco 141,500,000. About six million cigars were imported from Puerto Rico. Thirty-one million cigars were exported.

Cigar production elsewhere in the world has kept pace with the progress achieved in the United States. Many of the mechanical improvements which led to present-day developments originated in European shops. Leaf from Cuba, Santo Domingo, Mexico, Brazil, Paraguay, Java, Sumatra, Borneo, Jamaica, Philippine Islands, India, as well as the tobaccos grown in western Europe, constitute a supply of raw material of a wide range of quality, and sustain a cosmopolitan cigar industry.

E. G. BEINHART.

CIGARETTES. A cigarette is a roll of tobacco wrapped in paper or corn husk. It may be hand rolled or machine made. One end may be supplied with a paper tube to serve as a mouthpiece, or tipped with a thin strip of cork, glazed paper, silk or other material to prevent the cigarette from adhering to the moist lips of the smoker. Loosely folded paper or cotton is

sometimes placed in the tubes to filter the smoke and collect the condensates of the volatile materials. The most popular cigarette, however, is plain, without mouthpiece or tip. Machine made cigarettes are of various diameters and lengths, with a circumference of from 22 millimeters to 32 millimeters, and a length of from 55 millimeters (2.16 inches) to 100 millimeters (3.93 inches). The popular brands average 1.05 grams tobacco, or 2.31 pounds per thousand cigarettes. In the United States the federal excise tax rate established by the Revenue Act of 1942, is \$3.50 per thousand cigarettes weighing less than three pounds per thousand. The rate is \$8.50 per thousand cigarettes when they weigh more than three pounds per thousand. This tax rate effectively limits the production almost entirely to the "small" cigarette. Proposals have been made to change the tax rate on small cigarettes from a uniform single rate to a differential rate, similar to the differential rate applied to cigars, based upon the retail sale price.

History.—The early Spanish explorers found the natives in the West Indies and Mexico smoking cigarettes, the former using thin palm bark, and the latter corn (maize) husks to wrap the tobacco. The history of the early development of the cigarette in Europe is not clear. It apparently followed the pipe, snuff, the cigar, and chewing tobacco in popularity. It appears that the Spaniards substituted paper for the corn husk wrapper. Cigarette smoking spread throughout the Mediterranean and Black Sea countries, especially in those areas under Turkish influence during the early 19th century. Land in the Balkans and around the Black Sea is well adapted for the production of fine aromatic tobaccos.

The Crimean War (1854-1856) introduced the cigarette to the English Army fighting in the Crimea. After that war the returned soldiers created a market for Turkish cigarettes, and a few years later the first cigarette factory was opened in London. About the same time a substantial cigarette manufacturing business was developed in Egypt, using Turkish-grown tobacco, and the "Egyptian" cigarette became the standard of excellence in the world's markets.

Production in the United States began in 1867 with the arrival of men skilled in the art of blending Turkish tobaccos. The first operators made little progress, as they lacked experience in blending the domestic tobaccos, and the American smokers were reluctant to accept the highly aromatic leaf from the Balkans. A small industry was established, however, during the 1870's employing hand rollers, capable of producing 1,500 to 2,500 cigarettes per day. The tobacco users of that period chewed about twice as much tobacco as they smoked in cigars, three times as much as they smoked in pipes, and the cigarette lacked acceptance in good society.

In 1883 a patent was issued to James Bonsack, of Virginia, for what proved to be the first serviceable cigarette making machine. It was capable of producing 200 cigarettes per minute, and it marked the beginning of the mechanization of the tobacco industry. Improvements followed rapidly, so that the modern machine, with the supplementary packing and wrapping equipment, represents the most advanced development of the machinist's skill. Modern machines range in their capacities from 100 to 1,500 cigarettes per minute. Some of the smaller machines

may be operated by hand. The capacities of the larger machines range from 450 to 1,500 cigarettes per minute, dependent upon whether a plain or tipped product is to be made, the length of the cigarette and the character of the tobacco to be rolled. It is equipped with a hopper holding 50 to 135 pounds of cut tobacco, which it delivers as a continuous compact rod upon a strip of paper moving at a maximum rate of 340 feet per minute. The paper strip, fed from a roll, passes over a device which prints the manufacturer's trademark for each cigarette. Passing onto a folder belt, the paper receives the tobacco and continues through a folding device where the tobacco and paper are formed to the desired circumference and shape (round or oval). Starch or casein paste is applied to seal the paper into a cigarette rod, heat is applied to dry the paste, and a cutoff knife severs the rod into proper length. The knife is ingeniously adjusted to make a clean, sharp cut through the rapidly moving rod. The cigarettes drop onto a table where they are inspected by an attendant, placed in trays which hold about 3,800 cigarettes and sent on to the packing machine.

Instead of sealing the paper with paste the machine may crimp the two edges of the paper to make an effective and permanent seal. If desired the cigarettes can be supplied with tips of cork, silk, glazed paper or similar material. These materials, fed from bobbins, are applied by the machine to the paper strip before the tobacco is placed on it. The paper feed is so arranged that the tipping material receives a coating of adhesive on one side, is carried to position, pressed onto the paper and dried by a stream of warm air. Application of the tips to the paper reduces the rate of the high speed machines to about three-fourths of their production of plain cigarettes.

At the packing machines the trays of cigarettes are automatically emptied into a hopper from which they are fed into a compressing pocket where the shape of the package is determined, and the proper number of cigarettes are placed for each row of the package. The standard American package contains 20, although the number may range from 10 to 24 in different brands. The group of cigarettes is formed to proper size and pushed inside a mandrel, around which the foil and paper label have been wrapped. The ends are gummed, folded and sealed, and the package delivered to a runway, and moved under a wheel which applies a revenue excise stamp, when required. Prior to closing the package feeler pins operate to detect missing cigarettes, soft end cigarettes, long or short ones, and any defective package is automatically discarded by the machine. After receiving the revenue stamp the packages move forward to another machine where they are quickly wrapped in cellophane or similar moisture conserving material. They are then packed in cartons. The standard carton contains 200 cigarettes, and the standard shipping case for wholesale distribution contains 10,000 cigarettes.

Classification.—Cigarettes are classified according to the type or types of tobacco used in their blends (see TOBACCO). Where only one type is used such as Turkish or Burley, it may be described as a "straight Turkish" or "straight Burley," although a number of grades of leaf of the one type may be used. The English blend is made entirely of American flue-cured

tobacco, and was so named because of its great popularity in Great Britain and its Dominions. More recently flue-cured tobacco grown in Canada, India and parts of southern Africa, as well as Turkish leaf, acquired under the British Empire preference tariffs or trade agreements, have been substituted in some of the English brands.

Black tobacco cigarettes were preferred for a long time in Cuba, and other parts of the Caribbean area, in South America, Spain, Italy and France. Most of them are made from cigar tobaccos, although fire-cured leaf sometimes may be used. They may be wrapped with white paper, or with brown or black paper of heavier texture, which may carry added flavoring.

The American blend cigarette dominates the American market, and it is becoming increasingly popular throughout the world. It is a mixture of flue-cured, Burley, and Turkish tobaccos in the approximate proportion of 50, 40 and 10 per cent respectively—the proportions varying with different brands. Some brands may replace a part of the Burley type with Maryland tobacco; others may add a small portion of Latakia tobacco grown in Syria, Lebanon, and Palestine. A characteristic of Burley tobacco is its great capacity for absorbing sugar syrups and other flavorings, and it blends well with flue-cured and Turkish varieties to produce the most popular smoking mixture. It affords the largest market for maple sugar, since this sugar is a preferred flavoring for Burley tobacco. The American blend appeared in 1913, and under the impact of modern advertising rapidly achieved a dominant position, which it has maintained with increased production each year since.

"Roll-your-own" refers to those cigarettes which the smoker makes himself. He may use a simple mechanism to roll the paper around a short rod of tobacco, or deftly complete the entire operation with the fingers, moistening the gummed edge of the paper to seal the tube. It is estimated that the consumption of roll-your-own cigarettes equal six to eight per cent of the quantity that are factory made. Corn husks in booklets are still available in certain areas for use on roll-your-own cigarettes. Paper or corn husk wrappers pay an excise tax of one cent per book of 50 sheets. Most papers, however, are distributed with the tobacco in booklets of 24 papers, and in that quantity are tax free.

Manufacture.—The flue-cured, Burley and Maryland tobaccos used in cigarettes are stored in wooden casks or hogsheads. After purchase from the farmer on the auction warehouse floor, the leaf is treated in a conditioning machine of special construction, and the moisture content is made uniform at 12 to 14 per cent throughout the cask. The storage period ranges from one to three years. The Turkish tobacco is imported in bales, and a group of grades from several growing areas may be used to maintain uniformity in the blend from year to year.

When the tobacco is brought to the factory for processing the hogsheads are placed in a long chamber, where, by means of vacuum, moisture is added to prevent breakage and render it soft and pliable for stripping out the midrib or leaf stem, and removing any foreign material and dust. The Burley tobacco is dipped in the flavoring syrups or sauces, pressed lightly, and dried to proper moisture content, and mixed with the flue-cured, Turkish and other types that the manufacturer's formula requires. As many as 15 to

20 grades of any one type may be used to make up the blended mass. The tobacco is cut into shreds 4/10 to 3/4 millimeter in width. A top flavor may be sprayed on the cut, blended leaf, after which it is placed in large boxes, known as Saratogas, holding about 90 pounds, to mull for one to three days or longer, prior to its delivery to the cigarette making machine.

This preparation of the leaf is highly mechanized, and geared to high speed production. It requires close controls of the blend components and the moisture content, so that the shredded tobacco will handle properly on the cigarette forming machine.

The manufacture of "large" cigarettes has decreased rapidly, less than 700,000 being made in 1949. Their manufacture is confined to a few small factories, most of which are in New York City.

Production and Consumption.—The leaf tobacco required to manufacture the 1949 production in the United States was estimated at 1,100,000,000 pounds. The American smokers in that year spent approximately 3 1/4 billions of dollars for cigarettes. Of this sum \$1,232,728,000 represented federal excise taxes, while more than 325 millions of dollars were taken by 39 states which levy taxes on cigarettes. It is estimated that 600 millions of dollars were paid to the growers of the cigarette types of tobacco in 1949. The United States imported for cigarette purposes 60 million pounds of aromatic tobaccos from Turkey, Greece, Bulgaria, Palestine, and Syria, the USSR, and Southern Rhodesia. These imports had an approximate value of 45 millions of dollars.

The annual consumption per capita in the United States is about 2,390 cigarettes. Consumption of cigarettes was greatly stimulated during and after World Wars I and II, as shown in the following table taken from Bureau of Internal Revenue reports. Similar increases in consumption are reported in all countries throughout the world, especially since World War II. About

PRODUCTION OF CIGARETTES IN THE UNITED STATES

1880	532,000,000 small and large cigarettes
1900	3,254,130,630 small cigarettes
1910	8,644,335,407 " "
1912	13,167,093,515 " "
1920	47,430,105,055 " "
1930	123,802,186,217 " "
1940	189,371,258,171 " "
1949	384,979,357,849 " "

nine per cent of the 1949 production was exported or sold to sea stores free of tax.

Production in 1949 was carried on in 53 factories licensed by the Bureau of Internal Revenue. North Carolina led in production with great factories located at Durham, Reidsville, and Winston-Salem. Virginia ranked second with factories located at Richmond and Petersburg, Kentucky was third with Louisville as the center of production. These were followed by New Jersey, California, Pennsylvania, New York and Missouri.

Cigarette paper is a special tissue of highest quality, and of varying characteristics made to meet the demands of the cigarette manufacturer. Papers differ in density, filler, porosity and fire-holding capacity. Most American cigarettes are wrapped in white paper, but the manufacturer can supply papers of various colors and shades, and with flavors added to blend with the tobacco. Flax straw secured from the flaxseed producing areas is the chief ingredient in making cigarette

paper in the United States. For many years the major requirements were supplied by French paper makers, but now factories located in Massachusetts, New Jersey, and North Carolina supply nearly all of the paper used in the United States.

The quality of cigarettes is carefully protected by the manufacturer. Certain chemical correlations, such as nitrogen and nicotine contents, total carbohydrates and sugars are maintained in balanced proportions. Seasonal variations in the tobacco growing areas produce variations in the leaf composition from year to year. The manufacturers maintain laboratories to analyze the leaf in storage, to assist the tobacco expert in the factory in maintaining the composition of the blends, and to test the smoking qualities. Much of the modern cigarette advertising, in attempting to employ chemical values, has distorted the significance of the important components of high-grade smoking tobaccos.

"Low-nicotine" cigarettes are produced by treating the tobacco with solvents, which also remove in the extraction process some of the most desirable aromatic properties of the leaf. Tobacco varieties have been recently developed with low nicotine contents. Some of them lack the more desirable aromatics possessed by normal cigarette leaf, since fine smoking quality is correlated with a nicotine content of two to two and a half per cent, to satisfy the average smoker.

CIGNANI, chē-nyä'ně, **CONTE Carlo**, Italian painter: b. Bologna, May 15, 1628; d. Forlì, Sept. 6, 1719. A pupil of Francesco Albani's, he was greatly influenced by Guido Reni, Agostino Carracci, and especially Correggio, as borne out in his painting *The Assumption of the Virgin* at Forlì where he imitated Correggio's cupola fresco at Parma. His outlines and drapery possess an elaborate finish and his color and composition have that artificiality common to those he admired and imitated. Other fresco paintings of note are *François I Touching for King's Evil* at the Farnese Palace, the ovals supported by angels at Parma, and the frescos at San Michele in Bosco. Clement XI conferred on him several marks of distinction.

CIGNAROLI, chē-nyä-rô'lě, **Giovanni Bettino**, Italian painter: b. Verona, July 4, 1706; d. there, Dec. 1, 1770. One of the better Veronese historical painters, he was founder and director (1769) of a famous school of painting at Verona. His greatest painting is *Flight into Egypt* at Parma, and others include *Death of Rachel* at Venice, *Madonna with Saints* at Vienna, and *Transfiguration* at Verona. He is also known for his mythological works which appear at Bergamo and Ferrara. Influenced greatly by the works of Guido Reni and Correggio, he was himself a man of literary culture, writing with discrimination and taste on various subject.

CIGOLI, chē'gô-lě, **Lodovico Cardi da**, Italian painter and architect: b. Castelvécchio, Sept. 21, 1559; d. Rome, June 8, 1613. He studied painting under Alessandro Allori in Florence and architecture under Bernardo Buontalenti. His most celebrated picture, *St. Peter Curing*

the Lame Man, formerly adorned St. Peter's at Rome. Other paintings of note include *Martyrdom of St. Stephen*, *St. Francis Receiving the Stigmata*, and his most famous *Ecce Homo*, all at Florence; *Nativity* at Pistoia and *Story of Cupid and Psyche* at the Villa Borghese, Rome. He is especially renowned for having originated the baroque style of painting in Florence.

While not so prominent in architecture as in painting, he did design the façade of Santa Maria del Fiore, Florence; the entrance of the Salvati Chapel, San Marco, Florence; and several Florentine courts.

CILIA, sîl'i-à (Lat. *cilium*, eyelid), small, generally microscopic, hairlike organs or appendages, found on the surface of the tissues of most animals and in some vegetable organisms (as algae), chiefly on tissues which are in contact with water, or which produce fluid secretions. They are constantly in a state of active movement, and communicate to the fluid with which they are in contact a corresponding motion, called a vibratile or ciliary motion. In certain forms of free-swimming unicellular animals, this motion provides a means of locomotion.

CILIATA, sîl-i-ă'tă, a group of Protozoa, and to which belong most of the Infusoria (q.v.)

CILICIA, sî-lish'i-ă, in ancient geography the maritime country between Pamphylia on the west and Syria on the east, lying south of the Taurus Mountain range along the extreme north-eastern area of the Mediterranean Sea. The inhabitants of the northern portion lived in part a nomadic life while those in the east, on the fertile plains, were devoted to agriculture. In modern Turkey this district is known as Lesser Armenia and contains part of the vilayets of Seyhan and Maraş and the entire vilayet of İçel. The population is about 540,000, of whom many are Armenians.

History.—First conquered by Cyrus and made a satrapy of the Persian Empire, it was invaded by Alexander the Great in 333 B.C. who made it a Macedonian province and colonised it with Greeks. It fell to the Syrians after Alexander's death and the coast became inhabited with pirates who often raided as far as the Aegean and Ionian seas. They were eventually subdued by Pompey who, in 62 B.C. made most of Cilicia a Roman province, of which Marcus Tullius Cicero was proconsul in 51–50 B.C. It was invaded by Arabs in 710–711 A.D. and became part of the Byzantine Empire for some years. In 1080 the Armenians, who had been driven from their native land, set up an independent principality here which was called Little Armenia. It became a kingdom in 1198 and was conquered by the Mamelukes in 1375, eventually becoming part of the Ottoman Empire. It was the scene in 1909 of extensive massacres of the Christian Armenians by the Moslem Turks.

CIMABUE, chē-mă-bōō'ă, **Giovanni** (properly **CENNI DI PEPO**, chān'ně dē pā'pō), Florentine painter and mosaicist: b. Florence, Italy, c.1240; d. Pisa, c.1302. The 20th century has claimed for Cimabue the recognition in Italian art that he first won seven centuries ago. Research has at last established the identity of his great works, so long a cause of contention.

The first outstanding Florentine painter, he

lived in that period when art was as profitable as any industry. Florence was the wealthiest city in Europe, and painters were in demand. Yet there were no exhibitions or museums. The buyer simply went to the artist's workshop to order what he wanted, which made the painter's lot a favored one. The guilds were largely responsible for this. No man could get work unless he belonged to a guild, but a high quality of skill was demanded of each member. The artist had to live up to his written contract. As for the buyer, he had to pay in full—or be sued or jailed.

Cimabue first worked in the old Byzantine style, conventional and flat. Loyal to this form, though not content with it, he was constantly experimenting. Religious passion had to be expressed in narrative art for the church. Those who could not read could thus understand the Bible stories in paintings. Always hoping to make the Bible more comprehensible, Cimabue gradually gave up the Byzantine tradition, and through him the Florentine school emerged. Life and emotion were coming into Italian painting.

According to a traditional account, Cimabue was walking along a country path when he saw a boy skillfully drawing on a large flat stone. He was sketching sheep—drawing from life, a new feat for those days. Attracted by such unusual talent, Cimabue took the boy as his apprentice. This apprentice and pupil became the famous Giotto, who soon surpassed his master and laid the foundation for much of Western art.

Cimabue traveled from town to town decorating churches. Florentine painters were the best in Italy, and this energetic artist had more offers than he could accept. About the year 1290 he was assigned the tremendous task of decorating the church of San Francesco in Assisi. His part was the choir and transepts of the upper church, and the four evangelists in the cross vault. On the walls he gave the stories of St. Peter and St. Paul, and the legends of the Virgin scenes from the Apocalypse. His *Madonna Enthroned* is in the Uffizi Gallery in Florence. He was working on the apsidal mosaic at Pisa when he died.

CIMAROSA, chē-mā-rō-zā, **Domenico**, eminent Neapolitan dramatic composer: b. Aversa, near Naples, Italy, Dec. 17, 1749; d. Venice, Jan. 11, 1801. Cimarosa was Gluck's greatest contemporary among the Italians. With a facile style his operas were produced in such rapid succession that he was soon a rival of Giovanni Paisiello, then the king of opera. Even the famous Mozart suffered a partial eclipse when Cimarosa's later dramas were presented. Yet his life began with no fanfare.

The son of poor parents, he was orphaned as a young boy. Educated at a charity school, his musical talent was so marked that he was awarded a scholarship to the excellent Conservatorio Santa Maria di Loreto, where he remained for 11 years (1761–1772). He studied with celebrated teachers, learning singing from Gennaro Manna and Antonio Sacchini, counterpoint from Fedele Fenaroli, and composition from Niccolò Piccini.

His first opera, *Le stravaganze del conte*, was produced in Naples in 1772 with mediocre results. But the following year he brought out his brilliantly successful *La finta pargina* in Naples, and was then proclaimed a great composer.

Until 1781 he divided his time between Rome

and Naples, composing for each city, which was the custom of the day. 'As a masterstroke he presented two operas in Naples, one in Rome, and two in Turin. This spread his fame to all of Europe. His works were translated into other languages and performed abroad. In Vienna the emperor preferred the fluent Italian style to that of the German operas. He assembled an Italian company for *opera buffa* and Cimarosa provided many of the dramas. At this time Italian opera was so popular that even Mozart could not enter the competition, as his works were German.

Cimarosa went to St. Petersburg in 1789 as court composer and remained three years, composing three operas and 500 pieces of music for the court. His music was praised by the people, but Catherine the Great was not satisfied with his choral works. His real talent, of course, lay in comedy—the genuine Italian *opera buffa*.

He became imperial choirmaster in Vienna in 1792 at a fabulous salary, and here in the same year he wrote his masterpiece, *Il matrimonio segreto*, the only one of his 120 dramas that is still performed. So instantaneous was its success that it was repeated on the night of its first performance. After Cimarosa's return to Naples in 1793, the opera was presented 67 times in succession, and some critics said that it excelled Mozart.

The Italian composer's troubles began in 1799 when the French Army entered Naples, for he made no secret of his sympathy with the revolutionists. Because of this he was imprisoned and condemned to death—a sentence commuted to banishment at the insistence of the masses. But Cimarosa's spirit never recovered from his prison experience. While in Venice working on his new opera *Artemisia*, he died suddenly. A persistent rumor that he had been poisoned by Queen Caroline's orders because of his revolutionary views aroused general concern, and the pope's physician was sent to examine him. According to his sworn statement Cimarosa died of a gangrenous condition.

Besides his operas he wrote symphonies, requiems, masses, cantatas, motets, and oratorios.

CIMBRI, sim'bri, a tribe believed to have inhabited Jutland; with the Teutons they became enemies of Rome. In 113 B.C. masses of these barbarians overcame a Roman army in Noricum. They did not enter Italy but moved north to attack. The Romans sent two armies, but both were defeated. The victors then overran Gaul. Two new Roman armies were sent, but even they could not destroy them, and the Romans lost some 80,000 men in the conflict.

Hence arose the so-called Cimbrian Panic at Rome, where they feared an immediate invasion of Italy; but the Cimbri descended into Spain, whence the Celtiberians repulsed them.

Finally they stormed into Italy. But Gaius Marius had spent three years preparing for such an attack, and they were routed near Vercellae in the Po Valley (101 B.C.).

The nationality of the Cimbri is disputed. Some authorities believe they were Germanic; others say they were of the Celtic race. Their name certainly resembles the Celtic Cymry, and, according to Strabo and Plutarch, their armor and customs were very unlike those of Germany.

CIMICIFUGA, sim-ī-sif'ū-gā, from the Latin "to drive away," so named because cer-

tain species are used to drive away bugs and other insects. The plant is a genus of the crow-foot family, comprising about 20 species, natives of North America, Asia and Europe. The best known American species, because of their medicinal properties, are the bughane (*Cimicifuga americana*) (q.v.) and the black snakeroot or black cohosh (*C. racemosa*), supposed to be an antidote for the venom of serpents.

CIMMERIAN BOSPORUS, sî-mēr'î-ân bôs'pō-rūs, an ancient name for Kerch Strait.

CIMMERIANS, a tribe half-mythical, half-historical, described first in the Odyssey as dwelling beyond the ocean-stream, in thickest gloom, unvisited by Helios. Hence the term, "Cimmerian gloom." From Herodotus we learn that they originally inhabited the country between the Borysthènes and the Tanais, but expelled by the Scythians, they traveled along the shores of the Euxine, passed through Colchis and over the Halys, and entered Asia to the west of that river. Against this it is urged that the route by the Euxine would be impassable for a nomadic people, the Caucasus running down to the very shores of that sea. The sum of our certain knowledge respecting this people is, that they seem to have been the chief occupants of the Tauric Chersonesus (the Crimea), where they had a large city, near which were fortifications enclosing the isthmus by an earthen wall.

CIMON, kî-môn, Athenian general and statesman: b. about 502 B.C.; d. Citium, Cyprus, 449 B.C. He was a son of the great Miltiades. He fought against the Persians in the battle of Salamis 480 B.C., and shared with Aristides the chief command of the fleet sent to Asia to deliver the Greek colonies from the Persian yoke. The return of Aristides to Athens soon after left Cimon at the head of the whole naval force of Greece. He conquered the pirate-island of Scyros, subdued all the cities on the coast of Asia Minor, pursued the Persian fleet up the Eurymedon, destroyed more than 200 of their ships, and then, having landed, on the same day entirely defeated their army 469 B.C. He employed the spoil which he had taken in the embellishment of Athens, and in 463 reduced the revolted Thasians; but the popular leaders, beginning to fear his power, charged him on his return with having been corrupted by the king of Macedon. The charge was dropped, but when Cimon's policy of friendship to the Lacedaemonians ended in the latter insulting the troops sent by Athens to their aid, his opponents secured his banishment. He retired into Boeotia, and his request to be allowed to fight with the Athenians against the Lacedaemonians in 457 at Tanagra was refused. Eventually Cimon was recalled at the instance of Pericles to conclude a peace with Lacedaemon. He died while besieging Citium in Cyprus. His *Life* was written by Cornelius Nepos.

CINCHONA, sîn-kō'nā, **BARK**, the bark of several species of *Cinchona*, a genus of trees and shrubs of the family Rubiaceae. The following are the most important: *Cinchona flava cortex*, yellow cinchona bark, which occurs as quills covered with a brown epidermis, mottled with whitish yellow lichens, and also in flat cinnamon-colored pieces. They break with a fibrous fracture and the escape of a powder. Yellow bark is

rich in quinine, and 100 grains should yield not less than two grains of alkaloid. It is derived from *C. calisaya*, which grows in the peculiar cloudy regions of the Andes; *C. pallida cortex*, pale cinchona bark, from *C. officinalis*. It occurs always in quills covered with crustaceous lichens. Its fracture is short and not fibrous. It contains chiefly cinchonine. Two hundred grains of the bark yield about one grain of alkaloid. *C. suc-cirubra*, a native of Peru, appears to thrive in India. The bark occurs in flattened rough-fibrous, dark brown red pieces, which are covered with a brown-red epidermis. It breaks with a red fibrous fracture. It contains about equal quantities of cinchonine and quinine, and 100 grains of the powdered bark should yield not less than one and one half grains of alkaloid. The yellow bark is used in the form of decoction, extract, infusion and tincture. The pale bark is contained in *tincture cinchonae composita* and in *mixture ferri aromatica*. The cinchona barks contain, besides the alkaloids, certain acids having astringent properties, and are valuable as tonics in cases of great debility. Cinchona barks rich in quinine generally contain much lime, and their solutions are precipitated by sodium sulphate. See also QUININE.

CINCINNATI, Ohio, city and Hamilton County seat, on the Ohio River; 110 miles southwest of Columbus and, by river, about midway between Pittsburgh, Pa., and Cairo, Ill.; area 72.4 square miles. It is a river port and a port of entry (41st Customs District). It has boat connections with river ports and is served by eight railroads. It is a commercial and manufacturing center. In 1947, it ranked 14th among metropolitan areas of the United States in the value of its manufactures, and in its own state was surpassed by Cleveland alone. The city's population in 1950 was 503,998.

Topography.—Cincinnati's average altitude is about 540 feet. The city occupies the northern half of a circular amphitheater of hills about two and one half miles in diameter, bisected east and west by the Ohio River, which here makes a sharp southward sweep. The southern half of the hills is bisected north and south by the Licking River in the Kentucky suburbs. The northern semicircle rises from the river in two great terraces sloping northward to a third level at the summit, originally quite distinct but now much confused by grading. The lower platform is a bluff, about 65 feet above low water; the second, 50 to 100 feet higher. The crest hills (Mount Adams, Price Hill, Mount Auburn, Mount Washington, for example), 15 to 300 feet higher yet, are about 800 feet at the summits. The last of the original five inclined plane lines, built in the latter part of the 1800's for vehicular travel to these hills, ceased operation in 1949. The ravines that cut the hills, originally heavily wooded, are now replaced by residential areas overlooking the city. On the western side of the city from north to south runs Mill Creek, the remains of a once huge glacial stream. Its gently sloping valley, a half mile or more wide, forms an easy path into the heart of the city and was an indispensable factor in determining its position. The site of the city is a glacial moraine of gravel and boulders, traversed by the Ohio River. A moderate climate contributes to the city's advantages as a healthful place of residence. Temperatures average 75°F. in summer and 34°F. in winter. Pre-

precipitation is rather evenly divided over the year, ranging from an average high of 3.9 inches in March to an average low of 2.4 inches in October.

In 1950, the city extended for about 25 miles along the river front to a width of about 15 miles in an irregular block north from it. The standard metropolitan area of Cincinnati (as used by federal statisticians) includes all of the county in which it lies, as well as Campbell and Kenton counties in Kentucky. The river level is the site of the shipping business. It is called the Basin and contains some blighted areas. Here (at the foot of Broadway) are the Public Landing, a municipally-operated floating dock, and wharf boats. Three railroad bridges span the Ohio; those used by the Louisville and Nashville, the Chesapeake and Ohio, and the Southern railroads. Other bridges are the Central Bridge and the Ohio River Suspension Bridge (span, 1,057 feet). Of these five, the first two railroad bridges (which are also utilized for highway traffic) and the Central Bridge are owned by Kentucky. The next level above the river bank contains warehouse facilities and, above it, is the downtown retail business district. Beyond and above the business district are the residential sections; then, the many spacious and attractive suburbs such as Walnut Hills, Hyde Park, and Westwood.

Industry and Business.—Meat packing is one of the city's major industries, and meat products accounted for \$14,720,000 of the city's total production in 1947. The Procter and Gamble Company and the Andrew Jergens Company, with home offices in Cincinnati, provide a large part of the world's supply of soaps, detergents, and cosmetics. In 1949, the Procter and Gamble Company alone manufactured soap and allied products valued at \$696,670,926. Cincinnati claimed the distinction of being the world center for making milling machines, lathes, and planers; drilling, grinding, and cutter-sharpening machines; shapers and boring mills. In the field of mechanics, Cincinnati has a long and illustrious history. The Ohio River which in the beginning of Cincinnati's metal trades industry in the early 1800's, brought the iron ore and the coal needed to cast and forge the metal, eventually drove many of the metal fabricators away from its banks by a series of floods. Since 1947, when Mill Creek Barrier Dam was completed by army engineers at a cost of \$10,000,000, Cincinnati's industries have been safe from high water, though some (including the world's largest machine tool plant, belonging to the Cincinnati Milling Machine Company) are located in the suburbs, far from the rampaging Ohio. In 1947, out of an average total of 108,476 production workers in the Cincinnati area, 24,479 were engaged in producing machinery; 11,339 in fabricated metal products; and 5,363 worked in the primary metal industries.

Other Cincinnati industries also have a claim to fame. The Globe-Wernicke Company at Norwood, Ohio (in Cincinnati's metropolitan area), is one of the largest manufacturers of office equipment and filing supplies in the United States. Cincinnati has long been a printing and publishing center. The famous *Eclectic Readers* of William Holmes McGuffey (q.v.) were first published by a Cincinnati firm in the 1830's. In 1947, more than 12,000 employees were engaged in printing and publishing. Cincinnati's products of these industries include everything from playing cards made by the United States Playing Card Company (the largest of its kind in the world) to 75

major magazines, and almost every kind of industrial publication, particularly insurance manuals. Cincinnati is the home office for three great insurance companies, and is the largest of the inland bituminous coal trading centers of the United States. It is also one of the important brewing and distilling centers; in 1947, its product in malt liquor alone was valued at \$25,652,000.

As early as 1821, Cincinnati had 31 workers' "societies." The first real trade union in Ohio (Franklin Typographical Union) was organized there in 1828; and, in 1831, one of the first labor newspapers in the United States, the *Working Man's Shield*, was issued in the city. It was in Cincinnati, too, that the first large company in the United States (the Procter and Gamble Company) gave its employees Saturday half-holidays. About the same time (1887) the company also inaugurated the first of a series of plans for profit-sharing with its employees.

Government and Population.—Cincinnati is termed by some authorities on municipal government the "best governed city." It is especially proud of that designation because in the early 1900's it was often called the worst governed. When it was revealed in 1922 that the city was virtually bankrupt, having one of the lowest tax rates but the 4th highest per capita expenditures among the larger cities of the United States, a reform group (a coalition party of Democrats and Republicans), was established and began a movement for a new city charter. It won the election in 1924, defeating the opposition by a vote of 92,510 to 41,015. Under the new charter, which has since governed the city, the old council of thirty-two members has been replaced with a group of nine, each elected for a two-year term. The charter also provides that the council members themselves elect one of the nine as mayor, who acts as the chairman of the group and as the city's official greeter. The council, elected by proportional representation, hires a city manager to conduct the business of the city and implement council's decisions. The new charter also instituted civil service examinations for city employees. Cincinnati councilmen receive a salary of \$5,000 per year and \$1,000 additional for the mayor. The city manager receives \$25,000 a year. In the 12 councilmanic elections held between 1926 and 1948 under the new charter, the so-called Charter Party retained control for seven terms; the Republican Party had a majority for three terms, while an independent had the deciding vote for two terms in an equally divided council.

Though there are more than a million persons living within a 20-mile radius of downtown Cincinnati, only about half of these are under the jurisdiction of Cincinnati. In Hamilton County, which has an area of approximately 414 square miles, there are 12 townships, 7 cities (including Cincinnati), 6 health districts, 25 villages, 44 school districts, 1 library district, and 1 county park district. If the over-the-river communities in Kentucky that are less than 10 miles from downtown Cincinnati were added, the number of political subdivisions would be almost doubled. Like many another large city, one of Cincinnati's problems is how to eliminate or reduce the waste these overlapping governments incur.

The Cincinnati Master Plan, completed in 1948 at a cost of \$250,000 provides a blueprint for the city's development and for the coordination and redistribution of the traffic of a city that, like many others, finds its existing transportation facil-

ities inadequate. Among the improvements contemplated in the plan are motorways, industrial areas, recreation, public transit, urban redevelopment, river front redevelopment, and airports (including a master airport at Blue Ash, a few miles north of the city). The plan's ultimate completion is figured on an annual schedule by five-year stages, serving as a basis for the proposal of bond issues to finance the projects as they are submitted yearly to the voters.

Transportation and Communications.—

The Ohio River is the great, natural channel for the flow of commercial currents through one of America's most fertile and productive regions. Locks and dams have increased river traffic for heavy freight, such as coal, lumber, iron, steel, sand, cement and, since 1948, for the transportation of new automobiles by barge to southern distribution points. Cincinnati's annual millions of dollars of commerce are divided between river barges, steam and diesel towboats, freight trains, and motor trucks. Cincinnati acquired the distinction of owning a railroad after the Civil War. To offset the threat of railroads to Cincinnati's freight business with the South, a right-of-way was acquired by the city to Chattanooga, Tenn., 339 miles away. The Cincinnati Southern Railroad was completed in 1880 and, still city-owned, is operated under lease by the Southern Railway Company. The seven other railroads which serve Cincinnati are the Baltimore and Ohio, the Chesapeake and Ohio, the New York Central, the Louisville and Nashville, the Norfolk and Western, the Pennsylvania, and the Erie. It is also served by three major national highways. As of 1950, Cincinnati's airport facilities included the Greater Cincinnati Airport (located across the river in Kentucky) for major passenger airlines, Lunken Airport for air freight and private planes, and a number of lesser ports in the outlying suburbs. Cincinnati had five radio and three television stations in 1950 and three daily newspapers.

Education.—As of 1950, Cincinnati's public school system included 5 senior high schools, 6 junior high schools, 63 elementary schools, and 4 vocational high schools. Late afternoon and evening classes are held at the city's high schools as part of the adult education program. One school offers a regular school program adjusted to the needs of handicapped students. Sight-saving classes and courses in Braille are offered in the regular elementary and junior high schools. There is a school for the deaf and two elementary schools have classes for the hard of hearing. The Catholic archdiocese has a parochial system of elementary and high schools. The University of Cincinnati (see CINCINNATI, UNIVERSITY OF) dates back to Cincinnati College, founded in 1819. The university received its charter as a municipally-owned institution in 1874. It includes ten colleges, a summer school, and an evening college. The idea of the cooperative system of technical education (class room study combined with job experience) originated at the university. This idea, which has since been adopted by many other institutions in the United States and in other countries, is now used in Cincinnati's vocational high schools, also. Cincinnati is the home of Xavier University, the oldest Catholic university in Ohio, having been founded in 1831 by the Society of Jesus. Xavier's seismological observatory is one of the few in the United States. Among other Catholic institutions of higher

learning in the archdiocese of Cincinnati are Our Lady of Cincinnati College, College of Mount St. Joseph-on-the-Ohio (both for women), St. Gregory Minor Seminary, and Mount St. Mary Seminary of the West. The Ohio Mechanics Institute, founded in 1829, gives courses in mechanical trades and arts, and houses an industrial museum. The Art Academy (1869) of the Cincinnati Art Museum offers courses in drawing, painting, and sculpture. The Hebrew Union College, founded in 1875, oldest Jewish theological school in the Americas, has curricular affiliations with the University of Cincinnati. Courses in music are available at the Cincinnati Conservatory of Music (1867) and the College of Music; there are other specialized schools.

Libraries and Museums.—The Hamilton County (public) Library, with its main building in Cincinnati and branches scattered throughout the city and county, had about a million and a half volumes in 1950. It also owned valuable special collections such as Bibles, first editions of Audubon prints, books printed in or published about Cincinnati and the Ohio River Valley, as well as a letter written by Christopher Columbus. The library of the Historical and Philosophical Society of Ohio has priceless collections of local newspapers, letters and diaries of Cincinnati's early settlers, and historical pictures of the city and its activities. Other important libraries are those of the University of Cincinnati, with more than a half million items, including a collection of Stephen Foster memorabilia; and of Xavier University, housing about 56,000 bound volumes and manuscripts. The Bernheim Library of the Hebrew Union College is chiefly noted for its thousands of manuscripts and more than 100,000 volumes of Judaica and Hebraica. The Hamilton County Court House has an unusually complete law library; while the Mercantile Library, founded in 1853 and still operating under its original 10,000-year lease, has 124,000 volumes including a priceless collection of early Cincinnati directories. The Cincinnati Art Museum in Eden Park was opened in 1886 and has been greatly enlarged. In 1950 it had an art library, 50 exhibition rooms and galleries, and an auditorium seating 500. It is the home of Cincinnati's Civic Theater. The museum contains paintings of Gainsborough, Titian, Franz Hals, Rembrandt, and other masters, in addition to the best collection of paintings by Cincinnati's own Frank Duveneck (q.v.). In the former home of the Charles Phelps Taft family is the Taft Museum, with collections of enamels, jewelry, ceramics, and other objects of art, as well as paintings by Corot, Millet, Goya, Reynolds, and Turner. This museum (a gift to the city from Mr. and Mrs. Taft) was opened in 1932.

Buildings.—Notable among Cincinnati's interesting buildings is the Union Terminal (1933). Representing an investment of more than \$40,000,000, it is an impressive combination of beauty and utility. The city hall (1893) has stained glass windows picturing events in local history. The city owns the Cincinnati Music Hall and Exposition Building (1876) where concerts are given and conventions are held. The Cincinnati Gardens, completed in 1949 at a cost of \$3,500,000, has a seating capacity of 15,000 for conventions, sport events, other forms of entertainment ranging from rodeos to ice shows; and is the home of Cincinnati's ice hockey team, the Mohawks. The Terrace Plaza Hotel (1948), which

is also a business and shopping center, is one of the most striking examples of modern urban architecture of the period 1945-1950. Six of its floors are windowless. The building is reputed to have cost more than \$15,000,000. Laurel Homes, a slum-clearance project of the 1930's covers 16 blocks with apartments for 1,039 families, and Lincoln Court is one of a number of housing projects of the 1940's for Negro families.

Parks.—Cincinnati's park system covers more than 3,500 acres, with three major parks on the hills and a number of smaller ones throughout the city. The largest, Mount Airy Forest, has an area of more than 1,300 acres, with picnic grounds, riding paths, trails, and an arboretum. Ault Park (230 acres) and Alms Memorial Park (85 acres) afford fine river views. Eden Park (185 acres) in the northeastern section of the city consists of lawns, drives, and a lake which is part of the city's water supply system. It contains a conservatory with rare plants, and the Cincinnati Art Museum and the Art Academy are within its limits. Cincinnati Zoological Gardens are in a park-like setting with the zoo planned to show the animals in surroundings resembling as nearly as possible their natural habitat. In 1950, the city maintained 68 public neighborhood playfields. Coney Island Park is a 140-acre amusement center about 10 miles up the Ohio River. It was virtually destroyed in the flood of 1937, but was rebuilt that year with the use of wrought iron and steel to withstand damage from future floods.

Observatories.—In addition to Xavier University's seismological observatory, Cincinnati has the University of Cincinnati's astronomical observatory, the cornerstone of which was laid in 1843. The United States Weather Bureau's Cincinnati branch is called Abbe Observatory, honoring Cleveland Abbe (q.v.) astronomer and meteorologist, who became director of the observatory in 1868 and established the first weather service there in 1869.

Churches and Charities.—Among the scores of Cincinnati church buildings, some of the more notable are St. Monica's Cathedral, with bell tower; St. Francis de Sales' Church, with lofty spire and campanile; St. Peter in Chains Church (The Old Cathedral, built in 1845, which houses a copy of Murillo's painting, *The Liberation of St. Peter*, the original of which is in Mount St. Mary Seminary); Christ Episcopal Church, designed after old Stepney Church, London; Avondale Synagogue, its windows symbolically picturing the Hebrew holidays; St. Paul's Protestant Episcopal and St. Paul's Methodist Episcopal churches, the New Thought Temple and the Church of the New Jerusalem (Swedenborgian). Private benevolence, organized welfare, and municipal provision for general well-being have equipped the city for dealing with most alleviable human misfortune. In 1915, a community chest system was established. The Cincinnati General Hospital, completed in 1915, has 25 buildings with grounds covering 27 acres. The medical college of the University of Cincinnati is affiliated with this institution. Other hospitals are Bethesda, Children's, Christ, Deaconess, Good Samaritan, Holmes, Jewish, Longview, St. Francis, St. Mary's, and Mercy.

Music and Entertainment.—Beginning with its first singing school in 1796 (when the population was less than 1,000), music has always been an important factor in Cincinnati community

life. Several choral societies were organized in the second decade of the '1800's, and an annual Sängersfest was begun in 1849. The first May (musical) Festival was organized by Theodore Thomas in 1873. This biennial festival was held in the odd-numbered years until World War II interrupted the schedule; it is now held in the even-numbered years. Cincinnati's symphony orchestra, established in 1895, gave the city symphony concerts. Cincinnati also has annual summer and winter seasons of opera, and choral observances at Christmas time. Among Cincinnati's other annual events are a folk dancing festival, June song festival, a Hallowe'en carnival, a Good Friday pilgrimage up Mount Adams to the Catholic church of Immaculate Conception and Our Lady of Lourdes grotto; as well as art exhibits, a dahlia show, a rose show, a county fair, a pure food show, and a dog show.

History.—Cincinnati began as part of the Miami Purchase (see OHIO—History), between the Miami and Little Miami rivers in the Northwest Territory. In 1788, opposite the Licking River, Mathias Denman, Robert Patterson, and Israel Ludlow platted a town three quarters of a mile square (bounded today by Central Avenue, Broadway, Seventh Street, and the Ohio River). They called it Losantiville, a complicated combination of Latin, Greek, French, and Delaware Indian—the whole meaning "town opposite the mouth of the Licking River." The first settlers were brought in the same year. Trouble with the Indians in the Northwest Territory prompted the federal government to build Fort Washington just outside Losantiville's boundaries in 1789; and in 1790, Gen. Arthur St. Clair, newly-appointed governor of the territory, arrived. He laid out Hamilton County, naming it after Alexander Hamilton; made the new town its seat; and changed its name to Cincinnati, in honor of the famous society of officers of the American Revolution. (See CINCINNATI, SOCIETY OF THE.) By the end of 1790, Cincinnati had some 40 log houses. The first church (Presbyterian) was built that year, and the first school (pay) was opened with 30 scholars. Defeat of the militia by the Indians in 1790 and 1791, however, nearly caused the abandonment of the settlement; the fort's importance kept it alive. By 1792, 34 of its buildings were well-stocked warehouses, evidence of its commercial strength even then. *The Sentinel* appeared in 1793, one of the first papers west of the Allegheny Mountains. Canoe mail service to Pittsburgh began in 1794, and a keel boat packet line to the same city was organized. Cincinnati's population was 500 in 1795 and among its log cabins there were already some frame houses. In 1802, Cincinnati was incorporated as a town; by 1810, with a population of 2,300, it was the largest town in the state. In 1819, the town received a city charter. According to the first directory published that year, it had 9,873 inhabitants, mostly from the Northern and Middle states, but including also many foreigners. A book by Dr. Daniel Drake (q.v.), descriptive of the city in 1815, was translated into German. It is believed to have been instrumental in attracting to Cincinnati a large number of immigrants, especially Germans. The city's great development, however, came with the opening of the Miami Canal, the most important single influence in the history of Cincinnati. Ground for the canal was broken in 1825 at Middletown, Ohio, and the canal was completed to Cincinnati

in 1827. The canal helped to develop commerce, and also furnished water power for manufacturing. In 1846, a railroad connected Cincinnati with Columbus and Cleveland. From 1840 to 1859, population jumped from about 46,000 to 160,000. The influence of German immigration made it for years a typical German city. The advent of the Civil War found Cincinnati on the border line physically and politically. Located between the North and South, it was dependent on Southern trade yet was the site of a chief station on the Underground Railroad. When war actually broke out, Cincinnati became a strong Union city. Despite the collapse of the South, the city's postwar commerce boomed. It still looked south for trade. The Suspension Bridge, connecting the city with Kentucky, was opened in 1867. The city-owned railroad, connecting it with Chattanooga, Tenn., was completed in 1880. It was this latter move which saved the city's trade, desperately hard pushed by the successful competition of railroads with river transport. The 1900's saw Cincinnati a prosperous city which felt the national depression of the 1930's less than many of its sister cities. The year 1937 brought both fire and flood, but the city recovered from these disasters. In 1939, it had 72,401 production workers in its manufacturing plants turning out goods valued at \$269,017,000; in 1947, there were 108,476 such workers and the value of the product was \$777,201,000.

E. LEO KOESTER,
Cincinnati Chamber of Commerce.

CINCINNATI, The Society of the, oldest military society in America. Organized at the proposal of Maj. Gen. Henry Knox on May 10, 1783, at the close of the American Revolution by officers of the American Army (Continental Line) in cantonment at New Windsor near Newburgh, N. Y. Officers of the Continental Navy and French military and naval officers who had served with the American forces also participated in the organization of the society. The patriotic and charitable purposes of the society, as set forth in its Institution, adopted May 13, 1783, were: to perpetuate the mutual friendships formed during the war, to preserve the rights and liberties for which the founders of the society had fought, to promote national honor and union among the states, and to render assistance to those officers and their families unfortunately in need of receiving it. The original members each contributed one month's pay, according to their respective ranks, to form a fund for the relief of needy members and their families. At the time this form of relief constituted the only kind of pension given in the country, as federal pensions were not provided until many years later.

The society was named by its founders for the illustrious Roman general, Lucius Quinctius Cincinnatus, who led his army to victory and then returned to his plow, refusing all honors which the Roman senators sought to bestow upon him. This example the founders of the society followed at the conclusion of the war in returning to their respective occupations.

Organization.—The society was originally divided into and now consists of thirteen state societies—corresponding to the thirteen original states—of which those in Massachusetts, New York, New Jersey, Pennsylvania, Maryland, and South Carolina have preserved an unbroken existence. There was also a society in France. There were in all 2,431 original members of the society, including 2,029 in America, 356 in France, and 46 other general officers and officers of various corps and Canadian regiments.

Among the well known foreign members were the Marquis Marie de Lafayette, Baron Friedrich von Steuben, Comte Francois de Grasse, Johann Kalb (Baron de Kalb), Comte de Rochambeau, and Major Pierre Charles L'Enfant, the French military engineer who planned and laid out the city of Washington.

Among the founders of the Society of the Cincinnati, in addition to George Washington, were the following: Horatio Gates, first vice president general; Henry Knox, first secretary general; Alexander McDougall, first treasurer general; John Barry; Nathanael Greene; John Paul Jones; Thaddeus Kosciusko; Henry "Light-Horse Harry" Lee; William Moultrie; Francis Marion; John Peter Mühlenburg; Rufus Putnam; Arthur St. Clair; Philip Schuyler; John Sullivan; and Anthony Wayne.

The founders of the society unanimously elected George Washington as the first president general in 1783, and he continued in that office until his death in 1799. He was succeeded as president general by Alexander Hamilton, elected in 1800, and he in turn by the following: Charles C. Pinckney (1805); Thomas Pinckney (1825); Aaron Ogden (1829); Morgan Lewis (1839); William Popham (1844), who was the last Revolutionary officer to hold this post; Henry A. S. Dearborn (1848); Hamilton Fish (1854); William Wayne (1896); Winslow Warren (1902); John C. Daves (1932); Bryce Metcalf (1939); Isaac Anderson Pennypacker (1950); Edgar E. Hume (1950); and Richard H. Wilmer (1953).

Under a resolution adopted in 1950, presidents general and vice presidents general may not now hold office for more than one consecutive term of three years.

Membership Requirements.—For the purpose of perpetuating the existence of the society, the founders provided in the Institution that the right to membership should descend to their eldest male descendants or, in the event of the failure thereof, to those members of collateral branches of their families who should be judged most worthy of membership. This hereditary right of succession to membership, and the fear that the society might thus establish an organization of hereditary patricians or nobility, created an intense public opposition which continued for some years after the society was organized.

To quiet this opposition, Washington recommended the abandonment of the hereditary right to membership and, although this recommendation was adopted at a general meeting of the society in 1784, the resolution was not ratified by all of the fourteen constituent societies and the hereditary right of succession to membership continued unchanged. In 1953 the total number of hereditary members was 1,705.

In 1854 the society adopted a resolution, known as the "Rule of 1854," under which the eldest male descendant of any Revolutionary officer is generally eligible to membership, even though

his ancestor was not an original member of the society. Although the rules and regulations as to eligibility for membership vary somewhat in the fourteen constituent societies, the Rule of 1854 is observed and followed in all of them with the exception of the Pennsylvania society, which continues in its strict adherence to the original requirements set forth in the Institution.

Insignia.—The order of the society, or badge of membership, which is generally referred to as the Eagle of the Society, was designed by Maj. Pierre L'Enfant, one of the original members. An Eagle set in diamonds was presented to Washington by officers of the French Navy, and this diamond Eagle has been handed down since then to each succeeding president general and is worn by him on formal occasions as his badge of office.

L'Enfant also designed a diploma, or certificate of membership. The original copperplate, now in the Library of Congress, is still in use.

French Society.—Leaders of the French Army and Navy were among the founders of the Society of the Cincinnati in France. King Louis XVI granted them the right to wear the Eagle of the society, although at that time no foreign orders were permitted in France. The Comte d'Estaing and the Comte de Rochambeau were respectively the first president and vice president of the French Society of the Cincinnati. Many of the early members of this branch, including d'Estaing, perished on the guillotine during the French Revolution.

Headquarters.—The headquarters of the society are at 2118 Massachusetts Avenue, N. W., Washington, D.C. This property was the former residence of Captain Larz Anderson, a member of the society, and after his death it was presented to the society for a headquarters and museum in 1937 by his widow. The museum contains many items of historical interest, and is open to the public daily except Sundays and holidays without charge.

CINCINNATI, University of, was the first university in the United States to be municipally supported, its status as a municipal institution having been established by the Ohio general assembly in 1870. The beginnings of the university date back to 1819 when Cincinnati College and the Medical College of Ohio were founded. The latter became the University College of Medicine in 1896. The Cincinnati Law School, founded in 1833, became the University College of Law in 1918. The medical and law units of the university were each the first institutions of their type to be established west of the Alleghenies.

In 1858 the \$500,000 bequest of Charles McMicken to the city for a free university led to the establishment of the McMicken College of Liberal Arts. Other units of the university with dates of their establishment are as follows: College of Engineering (1900); Teachers College (1905); Graduate School of Arts and Sciences (1906); College of Business Administration (1912); College of Nursing and Health (1917); College of Applied Arts (1922); College of Home Economics (1924); Evening classes in the commerce and liberal arts divisions of the university were begun in 1912, and the Evening College was established in 1938. The Research Foundation was organized in 1943.

Closely affiliated with the university are Hebrew Union College, the Cincinnati Conservatory, Cincinnati College of Music, Cincinnati College

of Pharmacy, the Astronomical School, and Cincinnati Observatory. Cleveland Abbe, who became director of the observatory in 1868, inaugurated a daily system of weather reports from which developed the United States Weather Bureau.

The cooperative system of technological education was started at the university by Hermann Schneider in 1906. Under this arrangement classroom work is supplemented by practical experience and training in shops and manufacturing establishments.

In 1953 the university library had 661,527 volumes. Students are also able to use special libraries of other institutions in the city. The university faculty in 1952-1953 had 383 members. The institution is co-educational, and 15,204 students were registered for courses during the above designated academic year. At the same period the value of the physical plant was assessed at \$17,360,206 and the total endowment was \$11,854,180.

CINCINNATI SYMPHONY ORCHESTRA, founded in 1895 under the auspices of the Cincinnati Orchestra Association, and supported by stockholders and subscribers to a guarantee fund. In its first season the orchestra was conducted by Frank van der Stucken, Anton Seidl, and Henry Schrädick. For the second season van der Stucken was made sole conductor, and he remained until the spring of 1907 when the orchestra was temporarily disbanded because of the demands of the American Federation of Musicians.

The orchestra was reorganized in 1909 with Leopold Stokowski as conductor. In the fall of 1912 Ernst Kunwald succeeded Stokowski and continued until December 1917, when he was interned by the government as an enemy alien. For the balance of the 1917-1918 season the orchestra was led by guest conductors, and in 1918 Eugène Ysaÿe became permanent conductor. He was followed in 1922 by Fritz Reiner who continued until 1931, when Eugene Goossens was appointed to succeed him. Goossens conducted the orchestra until 1947 at which time Thor Johnson became conductor.

The presidents of the original association were Mrs. William Howard Taft (1895-1900), Mrs. Christian R. Holmes (1900-1913), and Mrs. Christian Phelps Taft (1913-1929). A financial crisis in 1929 necessitated reorganization, and the orchestra was incorporated under the auspices of the Cincinnati Institute of Fine Arts.

Besides its regular series of concerts the orchestra gives junior high school concerts, young people's concerts, "pop" concerts, and a number of concerts out of town.

CINCINNATIAN, *sin-si-nāt'i-ăn*, in geology the uppermost series of the Ordovician system in North America, formed during an epoch of 10 to 20 million years about 300 million years ago. The principal deposits in the East were eroded from rising land in western New England during the process of mountain making which culminated in the Taconic Orogeny at the close of the period. In central Pennsylvania 2,500 feet have stream-laid red sandstone at the top. Cincinnati rocks of the Arctic regions and western interior are limestones of a few hundred feet. The series is exposed typically in Ohio along the Cincinnati anticline, a broad rock fold from

central Tennessee to southern Georgian Bay, Ontario, formed in later geologic time. See also ORDOVICIAN.

CINCINNATUS, sîn-sî-nā'tūs, **Lucius Quinctius**, a patrician belonging to the earliest period of the Roman republic: b. about 519 B.C. The legend which has enshrined him as a model of Roman virtue is as follows: The Romans of his day were weakened by dissensions between the patricians and plebeians; the warlike Aequians, after making harassing incursions into their territory, succeeded at last in surrounding the Roman army under the consul Minucius in the wooded grounds of Mount Algidus. In despair the Roman senators went to Cincinnatus, offering him the dictatorship. The messengers found him at the plow. Reluctantly he accepted the office. He succeeded in rescuing the army from its perilous position, and marched to Rome laden with the spoils of victory. He refused all honors and returned to his farm, whence he was again called, at the age of 80, to resume the dictatorship, to oppose the machinations of Spurius Maelius, and prevent a civil war between the upper and lower classes, which he succeeded in doing.

CINCIUS ALIMENTUS, sîn'shî-ūs āl-ī-mēn'tūs, **Lucius**, Roman historian and statesman: fl. late 3d century B.C. In 210–209 B.C. he was praetor in Sicily, where he was briefly made prisoner by Hannibal during the Second Punic War. He wrote in Greek a history of Rome covering the period from the founding of the city, which he set at 729–728 B.C., down to his own day. This work, *Annales*, with the work of Quintus Fabius Pictor, whom he followed, formed the basis of the historical tradition which was established to interpret Roman institutions and policies to the Greek world.

CINCO SALTOS, sîng'kō sāl'tōs, town, Argentina, in northern Río Negro territory. It is on a railroad 30 miles west-northwest of Fuerte General Roca, and in an irrigated area on the Neuquén River. It is surrounded by farming country. There are sand and gypsum quarries, and lumbering and wine making are important activities. Pop. (1947 est.) 2,500.

CINCTURE, sîngk'tūr, a type of belt or girdle, which is a feature of practically every type of religious dress. In monastic orders, the cincture is a plain cord, a narrow band of cloth, or a leather belt. As a prelatical ornament, it is a broad strip of some fine material in black or other appropriate color and is adorned with fringe or tassels. For liturgical purposes, the cincture is generally a white cord used for drawing in the flowing folds of the alb.

There is some reason to believe that a girdle of this type was used in the Celtic church. Cinctures which are not Celtic survive from the 10th and 11th centuries. These are of rich material and are covered with much embroidery. Simpler types did not come into general use until late in the medieval period. The type of cincture, or sash, used in the civil dress of some church officials has been adapted for the use of choirboys and acolytes. Used thus, it has not the religious significance usually associated with it. Certain religious orders have special blessings for the cincture.

CINDERELLA, sîn-dēr-ēl'ā, heroine of an ancient tale, analogues of which exist in folk literatures throughout the world. The earliest known version dates from the 9th century A.D. in China.

The story in its best-known form tells of Cinderella, the household drudge, helping her sharp-tongued and ugly stepmother and two stepsisters dress for a ball at the palace. She patiently endures their taunts about not being able to go herself, but after they have left she sits sobbing by the fireplace in the kitchen. At this point her fairy godmother appears. She magically transforms Cinderella into a princess, a pumpkin into a golden coach, mice into horses, and sends Cinderella off to the ball. The only stipulation is that she must leave by midnight when the magic will wear off and everything turn back to what it was. The prince dances with Cinderella and falls in love with her. Unaware of passing time, Cinderella has to dash from the palace as midnight strikes. In her flight she loses one glass slipper. This the prince retrieves, swearing to search the kingdom until he finds the owner. Eventually his travels lead him to Cinderella, now back in her kitchen. To the anguish of the stepmother and the stepsisters who have tried to squeeze their feet into the tiny slipper, Cinderella slips it easily on to her foot. The prince then claims her as his bride and carries her away to become his princess.

This is the story as it appeared in a collection of fairy tales published in France in 1697. The book, known as *Histoires et Contes du Temps Passé*, bore on its frontispiece the inscription *Contes de Ma Mère l'Oye* (Mother Goose's Tales). Among other stories in this book are *The Sleeping Beauty*, *Red Riding Hood*, and *Bluebeard*. Charles Perrault (1628–1703) was responsible for the original collection which was translated into English by Robert Samber about 1729.

Perrault's version of Cinderella contains certain features not found in older versions of the story and omits elements found in other versions. In many of the latter Cinderella is helped by her dead mother who often appears as a cow, goat, or some other domesticated animal. In some renditions Cinderella goes to church or to a festival rather than to a ball. The midnight hour is Perrault's and so is the glass slipper. The Chinese version uses a golden slipper, and some tales of similar type use a ring.

The story has furnished outlines and plots for numerous ballets and operas. *Cendrillon*, a three-act comic opera with libretto and music respectively by the Frenchmen Charles Guillaume Étienne (1777–1845) and Nicolas Isouard (Nicolo) (1775–1818) was presented first in Paris on Feb. 22, 1810. The success of this work led to the appearance of several imitations.

Gioacchino Rossini's opera, *La Cenerentola*, first produced in Rome in 1817, was without a fairy godmother or any other supernatural element. Rossini had stipulated to his librettist, Jacopo Feretti, that these features be omitted. This was chiefly because the Italian stage of the period was not equipped for handling unusual effects. An operatic version much more faithful to Perrault's form of the story was *Cendrillon*, first produced in Paris on May 24, 1899, with a libretto by Henri Cain (1859–1937) and music by Jules Massenet.

An early ballet version was *Cendrillon* (1823)

by the French dancer Ferdinand-Albert Decombe (Albert) (1789–1865). Another ballet, *Cinderella* (1893), was the result of collaboration between the French dancer and choreographer, Marius Petipa (1822–1910), the Italian, Enrico Cecchetti (1850–1927), and the Russian, Lev Ivanov. Michel Fokine (1880–1942) choreographed a *Cinderella* ballet for the Original Ballet Russe in 1938. Sergei Prokoviev (1891–1953) composed the score for a *Cinderella* ballet first danced in Russia by Galina Ulanova. The English dancer and choreographer, Frederick Ashton (1906–), used the Prokoviev score for the Sadler's Wells Ballet's *Cinderella*, in which Margot Fonteyn and Moira Shearer have both danced. The first performance of this ballet was at Covent Garden, London, on Dec. 23, 1948.

CINEAS, sin'ê-ās, Thessalian politician of the late 4th and early 3d centuries B.C. He was a minister of King Pyrrhus of Epirus and warned Pyrrhus of the difficulties in attempting to win a decisive victory over the Romans. After the Romans had been defeated by Pyrrhus at Heraclea in 280 B.C., Cineas attempted without success to negotiate peace terms.

CINEMA, sin'ê-mā (Gr. *kinēma*, motion), shortened form of *cinematograph*. Both words are used in Europe to refer to moving pictures (q.v.).

CINEMASCOPE was first publicly demonstrated in the United States in the autumn of 1953. It was the third in a series of technical innovations brought forth by the motion picture industry in its efforts to win back some of the audience it had lost since the expansion of the television industry.

The word CinemaScope is the trade name for a revised photographic process first demonstrated and theatrically presented in New York City as early as 1930. It involves a method of distortion photography using a cylindrical lens component which compresses a wide scene into a narrow image. The distortion in pictures taken in this way is corrected by a projector equipped with a compensating lens which expands the images to normal proportions when they are thrown onto a slightly concave screen measuring 68 by 24 feet. A slight illusion of depth is created and the general range of vision approximates that of the human eye.

The result is less remarkable optically than Cinerama, but it is nevertheless impressive and avoids some of the difficulties of "three-eyed" Cinerama. Among the cinema techniques newly presented to the public in the early 1950's, CinemaScope has the advantage of using a single standard 35-mm. film. Theater projection equipment already in use is easily adapted for CinemaScope with a few attachments. But the new screen dimensions have introduced architectural problems for many theaters with long, narrow auditoriums. For some of them CinemaScope would be reduced to what is called a "mailslot view." This is because the delivered CinemaScope image requires a screen ratio which, after some fluctuation, has become fixed at 2.55 in width to 1 in height, compared with the 1.33 to 1 of standard pictures.

CinemaScope was the result of observations made in Europe by Earl I. Sponable, chief of technology for 20th Century-Fox. The invention is, for all its tangled history, credited to Henri

Chrétien of Paris, a French optical scientist. Spyros Skouras, president of 20th Century-Fox, interested in the possibilities of these anamorphic—or form-changing—lenses, brought all the resources of his organization to bear on the problem of developing the technique for commercial use.

The first experimental lenses arrived in Hollywood in January 1953, and the first public appearance of CinemaScope in the United States was the premiere of *The Robe* at the Roxy Theatre, New York City, on Sept. 16, 1953. The film was derived from the ten-year-old best-selling novel of the same name. The lay press generally acclaimed *The Robe* and the public was enthusiastic. The role of CinemaScope in this success was important. 20th Century-Fox announced that all its future productions would be filmed with the new lenses and other film companies began exploratory work under CinemaScope license. By the end of 1953, 200 theaters in the United States were equipped to exhibit CinemaScope motion pictures. By mid-summer of 1954 it was claimed that a total of 6,000 were in operation, nearly all of which were in the United States.

TERRY RAMSAYE.

CINERAMA is based on the principle of peripheral vision, bringing to the eye the sensations at the periphery of normal sight. The object fills the eye. One is aware not only of what is in front, but also of what is on both sides as far as the vision can reach. This gives the viewer an illusion of depth and makes the picture seem to have no limitation, no frame. The spectator seems to be in it; instead of merely looking at a picture, he has the impression of being himself a part of the scene. Someone has said that standard motion pictures are like looking into a room through a keyhole, while Cinerama is like being in the room.

Much of the dynamic effect of motion is derived from what one sees out of the corner of the eye. This is illustrated by the way a person will shy away from something coming from the side, glimpsed out of the corner of the eye. That is why the sensation of motion can be so vivid in Cinerama.

The pictures are taken with three synchronized cameras, on three separate films. These in turn are projected by three machines onto a deeply curved screen made of perpendicular strips of material. The curvature of the screen is basic for the optical effect produced. The arc of the screen and the optical focus are such as to heighten the effect of peripheral vision.

Cinerama was devised by Fred Waller, a veteran of motion picture technology. Beguiled by the problem of peripheral vision on the screen, he experimented for years, and made his first important demonstration at the New York World's Fair in 1939. During World War II the United States government became interested in his experiments and backed him in the development of a special gunnery trainer for airmen, using a circular screen that went all the way around a large room with one continuous motion picture, projected by eleven machines. Later on, Waller continued his experiments at the John D. Rockefeller home in New York City with funds provided by Lawrence Rockefeller and the backers of *Time* and *Life*. But at that stage neither the inventor nor those who financed him believed they had anything ready for the public.

Subsequently Hazard Reeves, the sound tech-

nician, became interested. From the Reeves laboratory came the stereophonic sound, which is all-important for Cinerama. Hazard Reeves in turn introduced Lowell Thomas, radio and film commentator, and producer of documentary films, to Cinerama. He soon interested Merian C. Cooper, top ranking film producer of Hollywood, and together Thomas and Cooper produced the first picture *This Is Cinerama*. The success was phenomenal, first in New York (Sept. 30, 1952), then Detroit, Los Angeles, and Chicago. People came from all over the world to see this new marvel of the entertainment world, with its principle of peripheral vision creating an illusion that viewers agree exceeds reality. In any real-life scene in daylight a diffused light fills the atmosphere; but when one looks at Cinerama, one is in a darkened theater—hence the effect of viewing a glowing scene in all its brilliant colors, at night. This is what makes Cinerama seem more real even than reality.

CINERARIA, a group of plants of the Compositae family, which appear to be various hybrids of *Senecio Cineraria*, a native of the Mediterranean region, and *S. cruentus*, from the Canary Islands. They have large hairy leaves and dense clusters of white, blue, pink or reddish flowers. They are extensively grown by florists as pot-plants, and by careful breeding a large number of varieties of various color and size have been obtained. Their long culture and breeding have resulted in a distinct group which might be called "florists' Cineraria."

For culture consult Bailey, L. H., *The Standard Encyclopedia of Horticulture*, vol. 1, pp. 771, 772 (New York 1939).

CINEY, sē-nā', town, Belgium, in Namur Province, in the southern part of the country, nine miles east-northeast of Dinant. It is a rail junction, and has an important horse market and metals industry. The town has been a market center since the 16th century. It is in the center of the Condruz district, ancient home of the German tribe, the Condrusi. Pop. (1948) 6,106.

CINGOLI, chēng'gō-lē (ancient CINGULUM), commune, Italy, located in Macerata Province in the central part of the country in the Marche region. It is near the Musone River, and is 17 miles by road west-northwest of Macerata. There are textile mills and a macaroni factory.

Cingoli is referred to by Julius Caesar in his *De bello civili* as having been founded by one of his lieutenants, Titus Labienus, in 63 B.C. Situated at an altitude of 2,300 feet, it was a strategically important point during the Roman civil wars. The town was nearly destroyed during the invasions of the Goths and Lombards. Some remains of the ancient walls still stand, and there is also a Gothic church which was rebuilt in 1278. Pop. (1951) 15,774.

CINI, chē'nē, Giovanni, Italian sculptor: d. about 1565. Most of his life was spent in Poland, where he went in 1507 at the call of Francesco Lori, architect to Sigismund I, king of Poland. Cini's chief work, undertaken with other artists, was the decoration of Sigismund's chapel in Krakow, richly sculptured and ornamented.

CINISELLO BALSAMO, chē-nē-zē'lō bāl'sē-mō, commune, Italy, in Milano Province,

Lombardy Region, of northern Italy. It is seven miles north of the city of Milan. It has a foundry and macaroni and soap factories. Pop. (1951) 15,265.

CINISI, chē'nē-zē, commune, Sicily, in Palermo Province, 14 miles west-northwest of the city of Palermo. It is in a cereal grain and grape-growing area, and has an ancient castle. Pop. (1951) 7,581.

CINNA, sīn'ā, Gaius Helvius, Roman poet of the 1st century B.C. He was a friend of the poet Catullus with whom he went to Bithynia on the staff of the governor, Memmius, in 57 B.C. Most of his poetry, fashioned on Alexandrian models and extremely obscure and erudite, has been lost. The *Zmyrna*, or *Smyrna*, which survives in fragments, deals with the incestuous love of a girl for her father.

It has been generally accepted, though there is some doubt, that this was the Cinna killed by the mob at the funeral of Julius Caesar in 44 B.C. Shakespeare, following Plutarch, depicts the lynching of Cinna in *Julius Caesar*. Despite his protestations that he is "Cinna the poet" he is taken to be Lucius Cornelius Cinna, the younger, who had expressed approval of Caesar's murder.

CINNA, sīn'ā, Lucius Cornelius, Roman patrician, associate of Marius and leader of the popular party, during the absence of Sulla in the East. In 86 B.C. he was elected consul along with Octavius, and in violation of his oath to Sulla he attempted to overpower the Senate and to procure the recall of Marius and his party from banishment. In the contest which ensued he was defeated by his colleague and driven from the city. His office thus became vacant, and the Senate appointed another consul in his stead. He soon returned, however, along with Marius, and laid siege to Rome. The Senate was forced to capitulate; but while the votes of the people were being taken for the repeal of the sentence against Marius, Cinna broke into the city, massacred the friends of Sulla and allowed his partisans to commit frightful excesses. He was consul for the next three years; but Sulla, having brought the Mithridatic War to a close, resolved (84 B.C.) to return to Italy to inflict condign punishment on his enemies. As Cinna was preparing to resist him by force of arms, he was slain by mutineers among his own troops.

His daughter CORNELIA became the first wife of Julius Caesar in 83 B.C. She died about 67 B.C.

His son LUCIUS CORNELIUS was praetor in 44 B.C. He was involved in the plot to assassinate Julius Caesar in 44 B.C.

CINNABAR, sīn'ā-bār, red sulphide of mercury, HgS. The native cinnabar occurs in earthy, granular and massive forms, and also in crystals belonging to the rhombohedral system. It is red, not infrequently with a brownish or leaden cast. Its hardness is from 2 to 2.5 and its specific gravity from 8 to 8.2. Artificial cinnabar, formed by subliming a mixture of sulphur and mercury, is brighter in color than the native mineral, probably on account of its greater purity, and is known in commerce as "vermilion." Cinnabar is the principal ore of mercury, and large deposits of it occur at Almaden, Spain, at Idria in Carniola, at New Almaden, Cal., and in certain parts of China and Japan. When it is roasted the sul-

phur burns away and metallic mercury distills off and is condensed in earthenware vessels.

CINNAMIC ACID, *sī-nām'ík*, an acid which exists in the free state in the balsams of Tolu and Peru, in liquid storax and in gum benzoin. It occurs in two forms, slender needle-like crystals, and large transparent prisms, melting at 270°F. When oil of cinnamon is exposed to the air it absorbs oxygen and deposits crystals of cinnamic acid, which are colorless and readily soluble in alcohol, ether and boiling water, but sparingly soluble in cold water. It is not of any importance in the arts and is chiefly interesting as being the acid corresponding to oil of cinnamon. This oil is the aldehyde of cinnamic acid and is represented by the formula $C_9H_8O_2$. Though isomeric with oil of cassia it has a slightly different flavor, and is much more expensive. Both of these oils are employed in medicine as aromatic stimulants, but chiefly as pleasant adjuncts to disguise the taste of nauseous drugs. From a chemical point of view, the cinnamic acid and oil of cinnamon are related to benzoic acid and oil of bitter almonds. Oxidizing agents convert it first into benzaldehyde and then into benzoic acid. It unites with hydrogen to form hydrocinnamic acid.

CINNAMOMUM. See CASSIA; CINNAMON; LAUREL.

CINNAMON, the bark of the under branches of a species of laurel (*Cinnamomum zeylanicum*), which is chiefly found in Ceylon, but grows also in Malabar and other parts of the East Indies. The tree attains a height of 20 or 30 feet. Its leaves are oval, the flowers are of a pale yellow color and the fruit is shaped somewhat like an acorn. There are two principal seasons of the year in which the Ceylonese bark the cinnamon trees. The first of these commences in April, and the last in November; the former being that in which the great crop is obtained. In this operation the branches of three years' growth are cut down, and the outside pellicle of the bark is scraped away. The twigs are then ripped up lengthwise with a knife and the bark is gradually loosened till it can be entirely taken off. It is then cut into slices and on being exposed to the sun curls up in drying. The smaller pieces, or "quills," as they are called, are inserted into the larger ones, and these are afterward tied into bundles. From the roots of the trees numerous offsets shoot up. These, when they have attained the height of about 10 feet, are cut down and barked, being then about the thickness of a common walking-stick. The cinnamon which they yield is much finer than any other. In Ceylon the cinnamon trees are said to be so common as to be used for fuel and other domestic purposes. The smell of cinnamon, particularly of the thinnest pieces, is delightfully fragrant, and its taste pungent and aromatic, with considerable sweetness and astringency. If infused in boiling water in a covered vessel it gives out much of its grateful flavor and forms an agreeable liquid. An oil is extracted from cinnamon, which is heavier than water. This is prepared in Ceylon, and almost wholly from the small and broken pieces. It is made, however, in such small quantities that the oil of cassia is generally substituted for it; indeed, the cassia bark is often substituted for cinnamon, to which it has some resem-

blance, although in its qualities it is much weaker. The leaves, the fruit and the root of the cinnamon plant all yield oil of considerable value. That from the fruit is highly fragrant, of thick consistency, and in Ceylon was formerly made into candles for the sole use of the king.

The oil of cinnamon consists mainly of cinnamic aldehyde, C_9H_8O , which, when pure, is colorless. By exposure to the air it absorbs oxygen and is converted into cinnamic acid (q.v.).

Various forms of cinnamon have been used for many years in medicine as flavoring agents and as carminatives. As cinnamon is rich in volatile oils, the action of the drug resembles the action of the oil of cinnamon, which is closely allied to other volatile oils (q.v.). The active principle in the oil is an aldehyde of cinnamic acid, and its antiseptic and antispasmodic action is due in large part to the cinnamic aldehyde.

CINO DA PISTOIA, *ché'nò dā pēs-tō'-yā*, Italian poet and jurisconsult: b. Pistoia 1270?; d. there, 1336 or 1337. He received the doctor's degree from the celebrated law school of Bologna, and from 1321 to 1333 taught law at the universities of Siena, Perugia, and Naples. Cino ranks among the best lyric poets of early Italian literature and both Dante and Petrarch seem to have greatly admired his poems. About 200 sonnets and *canzoni* have been preserved, most of them dealing with his unhappy love for a lady of Pistoia; they all show a musical sense of rhythm and a vivid imagination in expressing love, sorrow, anxiety, and the fear of death. One of the editions of his poems was prepared by Giosuè Carducci (Florence 1862 and 1864). Cino's most important juridical work is *Lectura in Codicem*, a commentary on the first nine books of Justinian's code.

CINQ-MARS, *sān-mār'*, MARQUIS DE (HENRI COIFFIER DE RUZÉ), French courtier: b. 1620; d. Lyon, Sept. 12, 1642. At the age of 18 he was presented at court by Cardinal de Richelieu and soon obtained the favor of Louis XIII, to whom he became master of the horse. Chafing at the restraint under which Richelieu held him and ambitious of political power, he framed a conspiracy to overthrow the cardinal, of which the king himself and his brother, Gaston, Duc d'Orléans, were members. But Louis was weak and fickle, Gaston perfidious and Richelieu not the man to be put down by a youth just turned 20. Cinq-Mars was delivered up to the cardinal and beheaded at Lyon with his friend, the councillor de Thou. The conspiracy of Cinq-Mars is the basis for a novel by Alfred de Vigny entitled *Cinq-Mars* (q.v.).

CINQ-MARS, by Alfred de Vigny, is one of the most popular French historic novels. Published in 1826, it showed unmistakable traces of the influence of Sir Walter Scott and was an immediate success. The novel deals with that important and interesting period of French history which culminated in the sway of Cardinal Richelieu, the minister of Louis XIII. It is Richelieu, more than the favorite of the king, Cinq-Mars, who is the central figure of the story. The author does not keep very strictly to the historic facts and misrepresents to a great extent the characters which he portrays. For de Vigny, Richelieu is a symbol of ambition, while de Thou, the devoted follower of Cinq-Mars, is the type of the friend. Even the minor characters of the book

CINQUE PORTS—CINTRA

are treated according to the preconceived idea of the author. The novel is thus a curious mixture of history and fiction. But in spite of the falseness of the historic treatment there is much in the novel which explains and in a way justifies its wide popularity. There was a great revival of interest in the past at the time the book was written, and no other period, perhaps, was so full of dramatic incidents and gave such opportunities for character study as that of the administration of Richelieu. Again, the lyric note of the novel is admirable. The picture in the opening chapter of beautiful and peaceful Touraine, where the author himself was born and which he knew well and loved, together with passages of similar charm and beauty, such as the description of the château of Chambord, are veritable poetic gems—and, after all, was not Alfred de Vigny primarily a poet? The reader will gladly overlook the historical inaccuracies, which were intentional, and will forgive the rather poor psychology of the characters for the sake of the spirited and entertaining story and the passages of exquisite description.

RAYMOND WEEKS,
Formerly Professor of Romance Languages and Literatures, Columbia University.

CINQUE PORTS, singk pōrts, a group of towns, originally five in number (hence the name), situated on the southeast coast of England, in the counties of Kent and Sussex. From the original five towns (Hastings, Romney, Hythe, Dover, Sandwich), which were associated to provide the crown with ships to patrol the straits, the association grew to include, at one time, over 30 ports, two of which, Winchelsea and Rye, were considered, with the original five, as head ports. The remaining members, whether corporate or non-corporate towns, were given the title of "limb" or member and held a subordinate position. The association's jurisdiction extended along the coast from Seaford in Sussex to Birchington, near Margate, in Kent, and included a number of inland districts at a considerable distance from the ports with which they were connected.

The incorporation of the Cinque Ports arose from their strategic position in relation to the Continent and the necessity of defending the southern seaboard in days before the existence of the Royal Navy. The oldest charter of the organization now extant is one which dates from the sixth year of Edward I (1278) but it refers to previous documents of the times of Edward the Confessor (r. 1042–1066) and William the Conqueror (r. 1066–1087), showing that the association is much older. The actual date of its foundation is obscure, but it may even ascend to the counts of the Saxon shore in the 4th century. The decline of the Cinque Ports began with the creation of the Royal Navy in Tudor times, and their charters were surrendered to the crown in 1685. Most of their peculiar privileges and obligations were abolished by the Reform Act (1832) and the Municipal Corporations Act (1835). The Warden's Court, however, still exercises an Admiralty jurisdiction, which was specially reserved to it when its civil jurisdiction was abolished in 1869.

The privileges enjoyed by the towns included exemption from all taxes, aids, and tallages; the right of civil and criminal jurisdiction within their limits; the right of assembling in their own port-moot, or parliament, at Shepway, near

Hythe, for the purpose of making bylaws; and several other privileges, including the right of regulating the Yarmouth fishery and fair. In return the ports were to furnish the crown with 57 ships for 15 days each year, and there is one instance on record where they had to furnish supplies for the ships provided by London.

The officer in command of the ships furnished by the Cinque Ports was the lord warden. Since 1700 the office has been held by such personages as Prince George of Denmark (husband of Queen Anne), the duke of Wellington, Viscount Palmerston, the 3d marquess of Salisbury, King George V (when prince of Wales) and Sir Winston Churchill, who became lord warden in 1941. The lord warden is concurrently constable of Dover Castle and until 1903 had another official residence at Walmer Castle. The present emoluments of the office are insignificant and the duties are negligible.

With the exception of Dover, the towns are now important only as seaside resorts. Changes in the coastline have necessitated expensive harbor works, and two of the head ports, Winchelsea and Rye, now lie inland, while Romney and Hythe have been forced partially to rebuild. The populations of the seven head ports are (1951 census) Hastings, 65,506; Romney (New Romney), 2,356; Hythe, 9,218; Dover, 35,217; Sandwich, 4,142; Winchelsea (est.), 130; and Rye, 4,511.

RICHARD WEBB,
British Information Service, New York.

CINQUECENTO, ching-kwê-chên'tō, in Italian, 500, an abbreviation for *mille cinquecento*, or 1,500. The term designates such art and literary styles of the 16th century as were developed about, or after, 1500. In like manner the terms *trecento* and *quattrocento* denote art and literature of the 14th and the 15th centuries. The cinquecento is the period of the highest perfection of the arts of the Revival or Renaissance.

CINQUEFOIL, singk'foil. (1) *In botany*, a species of the genus *Potentilla* of the rose family, closely allied to the strawberry. Of the approximately 300 species in the north temperate zone, 175 occur in North America, scattered throughout the continent. The name is from *cinque* (five) plus *foil* (Fr. *feuille*, leaf) referring to the five leaflets in many of the species. In northern New England the shrubby or bush cinquefoil (*P. fruticosa*) is a troublesome weed. This is sometimes called hardhack, but the true hardhack is *Spiraea tomentosa*. *Potentilla* is from Latin *potens* (powerful), from the supposed powerful medicinal virtues of some of the species.

(2) *In architecture*, it is an ornament in the Gothic style, consisting of five foliated divisions, often seen in circular windows.

(3) *In heraldry*, it means a five-petalled corolla borne without a stalk and set fullfaced, used as an emblem in a coat of arms.

CINQUEPACE, sing-kê-pās', a kind of stately dance of the 16th century, in which steps were regulated by the number five.

CINTRA, town, Portugal. See **SINTRA**.

CIOTAT, La. See LA CIOTAT.

CIPHER, sî'fēr, a kind of monogram, in which the initials of a person or persons are intertwined.

CIPHER AND CODE WRITING, the art of concealing the true meaning of a message from any but the intended recipient. It is a branch of cryptography (q.v.). As soon as literacy became reasonably widespread, soldiers, diplomats, and, probably, criminals, wishing to communicate privately with one another, began to devise methods of secret writing.

Methods.—One fairly obvious method is to use a language (either real or invented for the occasion) which is unlikely to be known to anyone except the person for whom the message is intended. A secret language of this kind is called a code.

Another method, known to have been used by the Spartans as early as 404 B.C., is to scramble the letters of the original or "clear" message by a scheme known to the recipient, who then can rearrange the apparent jumble of letters to reveal the sense. This is known as a transposition cipher. The method used by the Spartans was to wind a belt spirally round a thick wooden rod and to write the "clear" on it, so that when the belt was unwound it seemed to be covered with meaningless letters. (As belts so decorated were commonly worn at that time, no suspicion would be aroused.) The recipient wound the belt on another rod of the same diameter as that used by the sender and read the message.

The third basic method is to use a private alphabet, in which the letters of the original "clear" are replaced by other letters or by specially invented symbols. This is a substitution cipher. A simple substitution cipher is the Julian, reputedly invented about 58 B.C. by Julius Caesar, in which each letter is replaced by the one following it in the alphabet. By this system "HIDE AT ONCE" becomes "IJEF BU PODF." The Morse code, so called, is really a substitution cipher, in which each letter is replaced by an arrangement of dots and dashes, or long and short sounds in actual telegraphy. (See TELEGRAPHY—*Telegraph Alphabets*.)

All known methods of preventing an unauthorized reader from solving the true meaning of a message are developments or combinations of the code, the transposition cipher, or the substitution cipher. The last 2,000 years have produced no fundamentally new technique.

Codes.—For most of this period codes underwent no major development, being in effect artificial languages of normal construction, in which a word in the code language would correspond directly with a word in some normal tongue, such as French or English. The "thieves' cant" of the Middle Ages and cockney rhyming slang, in which "stairs" became first "apples and pears" and, in the finally developed form of the code, merely "apples," are examples. The invention of the telegraph, with its charges by the word, encouraged the development of codes in which one word or "group" of the code may stand for a complete sentence. A well-known example is the International Code group SOS, meaning "I AM IN DANGER AND REQUIRE IMMEDIATE HELP." This condensation is characteristic of all codes in general use today—both the International and Commercial codes, which are not se-

cret, as anyone can obtain copies of the code books or dictionaries used, and the secret codes used by governments of the world for diplomatic and military communication. Many readers will remember the numeral code used to transmit family messages to servicemen during World War II. A serious disadvantage of the code for many applications is that it is difficult, if not impossible, to learn it by heart, so that a code book—really a dictionary of the code language—must be used. Not only is this usually very bulky, but, if it should fall into the wrong hands, even temporarily, the secrecy of the code is compromised.

Ciphers.—Ciphers, both substitution and transposition, are normally much easier to carry in the head, but are also more easily "broken" or reconstructed from the cipher message by someone not in possession of the key. For this reason they have developed steadily in complexity and difficulty since their introduction, as the result of the continual war between the cipherer and the decipherer.

Transposition.—The transposition cipher is essentially a form of anagram. If the relative frequency of the letters in the message is normal for the language in which it is written, then a transposition cipher almost certainly has been used. The general method of solution is to find the letters in the message that normally come together (as TH, HE, ING, in English) and to try to establish some periodicity in their appearance from which the "mixing up" method may be deduced. A variant of the transposition cipher jumbles complete words instead of letters—a system used by the Union Army in the Civil War. It may be attacked by essentially the same method, usually by bringing together adjectives and nouns (like "prepared" and "positions"), which look as if they may belong with each other.

Apart from the already discussed Spartan system, transposition ciphers may be constructed by writing the "clear" message in horizontal lines each containing an equal number of letters, then by copying the vertical columns or the diagonals, or by following any other trace through the rectangle so formed. By this method the "clear" "HIDE AT ONCE" may be put down as a rectangle

HIDE
ATON
CEXZ

and transmitted as "HACE XZNE DITO" by following an anticlockwise spiral, beginning at the top left-hand corner. The meaningless letters xz, inserted to complete the rectangle, are called "nulls."

It is customary in all cipher work to ignore the divisions between words and to write the message in arbitrary "groups," since the preservation of normal word divisions greatly aids the decipherer.

Another method of producing a form of transposition cipher is the Cardan grill, a sheet of cardboard or similar material with holes cut in it. This is placed on a sheet of paper and the words or letters of the "clear" message written through the holes. The grill is then removed and the rest of the paper is filled with meaningless words or letters. The recipient has an identical grill, lays it on the sheet, and reads the message. Ciphers in which, for example, each second word after a comma must be read to give the true message are based on the same principle. Grill ciphers can be hard to break, but they are

cumbersome to use, and their usefulness is rather limited by the fact that in most cases the actual sheet of paper used by the sender must be transmitted to the receiver.

Substitution.—The simple substitution cipher is practically confined to nonsecret applications, such as the Morse code, a few "secret societies," and children's groups associated with some breakfast cereal. To break such a cipher it is only necessary to prepare a table of the frequency of appearance of the various symbols and to assign to the most frequently appearing symbol the most frequently appearing letter in the language used (e in English), and so on down the line; then, unless it is so short that no reliable frequency table can be constructed, the message falls apart. Worked-through examples of the breaking of a simple substitution cipher will be found in Edgar Allan Poe's *The Gold Bug* (1843), Arthur Conan Doyle's *The Adventure of the Dancing Men* (1903); and in the article CRYPTOGRAPHY in this encyclopedia.

By the 16th century most substitution ciphers had surmounted this difficulty by providing more than one equivalent for the commoner letters, but this simple cipher with suppression of frequencies did not preserve its secrets for long, as groups of symbols differing only slightly may be assumed to represent some common group of letters (such as ENCE), and lists of equivalent symbols may be composed, after which the cipher reverts to a simple substitution.

Most modern substitution ciphers are of the "double substitution" type, in which a different cipher alphabet is used to encipher each successive letter of the clear text. Ciphers of this kind, and the method of their solution, are described in more detail in the article CRYPTOGRAPHY.

Syllabic.—A hybrid between the substitution cipher and the code, not now much used but very popular in the 17th century, is the syllabic cipher, in which each symbol represents a complete syllable. For example if DEM = 57, oc = 38, and RAT = 66, then 57-38-66 is the encipherment of DEMOCRAT. Such a cipher, of course, must be attacked with a relative frequency table for syllables instead of for letters, but apart from this the general method of solution is the same as for any other substitution cipher.

Insolubility.—The question often is asked whether there is such a thing as an insoluble code or cipher. The answer is yes, with reservations. Even the most elementary simple substitution cipher is practically insoluble, if it is used once only in a message so short that no reliable table of letter frequencies can be established and if the would-be solver has no clue as to the wording of the original clear text. Ciphers have been constructed that can be proved mathematically to be insoluble without the key, even if the general method of their formation is known, but they either are unacceptably cumbersome to use or have the fatal practical defect that one mistake in encipherment or transmission makes irretrievable nonsense of the rest. Diplomatic and, to a lesser extent, naval messages, composed and encoded by skilled men in no particular hurry and with all the apparatus (often including mechanical ciphering machines) which they desire at their disposal, written first in code and then ciphered, usually by both substitution and transposition methods, are very close to insolubility, though they have been broken. On the other hand, a signal, in some necessarily fairly simple cipher, radioed back

from a forward observation post by a frightened sentry under heavy attack, seldom will resist skilled analysis for more than a few minutes. If, however, by the time that the signal has been deciphered the information which it contains is of no use to the unauthorized reader, the cipher has served its purpose. A code or cipher is like a safe. No safe or strongbox is absolutely impregnable, but it is designed in ratio to the value of its contents, so that the time and the effort which a burglar would need to "crack" it is, at worst, greater than the contents are worth or, at best, enough to keep him occupied until the police arrive.

There are not many books on the subject generally available in English and fewer still are in print. An excellent summary of the history of codes and ciphers, with very full explanations of their construction and solution, may be found in Fletcher Pratt's *Secret and Urgent* (New York 1942).

PAUL D. HOBSON,
Lieutenant (E) Royal Navy, Retired.

CIPHERS, signs for numbers. They are either borrowed signs, as letters, with which the Greeks and several tribes of northern Europe designate their numbers; or peculiar characters, as the modern or so-called Arabic ones, though the Arabs do not use them and never did. The ciphers now in use—1, 2, 3, 4, 5, 6, 7, 8, 9, and 0—did not attain their present character until about the first half of the 14th century. As early as the 9th century ciphers were used, though not until the 11th century did their use become common in Europe.

CIPPUS, sip'ūs, a low column, generally rectangular, sometimes cylindrical, usually sculptured, and often bearing an inscription, used by the Romans for various purposes. Cippi served as sepulchral monuments, as milestones and boundaries, and in some cases as pillars or posts whereon were inscribed laws and notices. They were frequently or usually adorned with rams' heads supporting festoons of flowers, figures of sphinxes, and various mythological subjects. Those serving as tombstones bore deceased's epitaph, name, and the dates of birth and death.

CIPRIANI, chē-prē-ā'nē, Amilcare, Italian revolutionist: b. Anzio, Italy, in 1845; d. Paris, France, May 2, 1918. An ardent follower of Giuseppe Garibaldi and Giuseppe Mazzini (qq.v.), he fought and worked for Italian independence. At the age of 14 he fought at the Battle of Solferino (1859), went with Garibaldi in 1860-1862 to Sicily, Naples, and Aspromonte; supported Karl Marx in forming the International Workingmen's Association; and was in Paris aiding the Commune at the close of the Franco-Prussian War (1870-1871). For his revolutionary activities in Italy he was sentenced to imprisonment, but the electors of Rimini, Forlì, and Ravenna saved him by electing him 11 times to the Chamber of Deputies. Pardoned in 1888, he lived for a time in France, but returned to Italy in 1891, when he was imprisoned for several years. He was a delegate to the International Socialist Congress in Zurich in 1893. At the outbreak of the Graeco-Turkish War he joined the Greeks and was wounded at the Battle of Domokos (1897). In 1913 he refused to take an oath of loyalty to the king and returned to Paris, where he edited a

Republican-Socialist journal. In World War I he urged Italian participation on the side of the Allies.

CIPRIANI, Giovanni Battista, Italian historical painter: b. Florence, Italy, 1727; d. London, England, Dec. 14, 1785. While living in Rome, he met Sir William Chambers, an English architect, whom he accompanied in 1755 to London, where he made his home. There he managed a school of art and became one of the first members of the Royal Academy in 1768. His drawings were his best work, many of them being engraved by Francesco Bartolozzi. The panels on the state coach used in the coronation procession were painted by him. He was buried in Chelsea, London, where a monument by Bartolozzi was erected to his memory.

CIRCARS, Northern. See **NORTHERN CIRCARS**.

CIRCASSIA, sēr-kāsh'ī-ā, historical area, in the northwest foothills of the Greater Caucasus Mountains, Russian SFSR, administratively divided into two autonomous regions: Adygei in Krasnodar Territory and Cherkess in Stavropol Territory. The Adygei Region has an area of 1,700 square miles, and lies mainly in the valley of the Belaya River, a tributary of the Kuban. Its capital is Maikop, the center of a huge oil field and a city with food-processing and wood-working industries. To the east is the Cherkess Region, with an area of 1,540 square miles. The capital is Cherkessk, which has food-processing industries, but is better known as the northern terminus of the highway across the Greater Caucasus Mountains to Sukhumi on the Black Sea coast. Both regions have a mild, moist climate, and consist geographically of northern lowlands and southern mountains. Grain and sunflowers are the main crops on the lowlands, where there is considerable dairy farming. Livestock raising on mountain pastures is the chief upland occupation, but timber cutting is an important industry. The lowland population is predominantly Russian, with Circassians largely confined to the mountains.

The Circassians (more properly Adygei or Cherkess) follow the Moslem religion and are a Japhetic race related to Georgians and Armenians. They are a sturdy, handsome people, and Circassian men are among the finest equestrians in the world. Before World War I many Circassian women were found in Turkish harems, where they were highly prized for their beauty.

The origins of the Circassians are lost in antiquity. During the Middle Ages they occupied much of the northwest of the Greater Caucasus Mountains, with their capital at the Black Sea port of Sukhumi. From the 10th to the 13th centuries Circassia was under the rule of Georgia. Thereafter the Circassians maintained a precarious independence for several centuries, fighting and occasionally paying tribute to the Crimean Tatars. In the 16th century czarist Russia began to aid Circassia in this struggle. By 1705, the Tatars were finally defeated, after which the Russians themselves began slowly encroaching on Circassian territory. Russia seized all Circassia in 1829, on the legal pretext that it was territory ceded by Turkey as a result of a Russo-Turkish war. Actually Turkey never had ruled Circassia, but had merely maintained a trading station on

the coast. The Circassians rebelled against Russian occupation and fought a valiant, but hopeless, battle for independence until 1864, largely under the leadership of the great Caucasian hero Shaml. Local patriotism was so intense that, when the Russian armies finally won, most Circassians refused to remain in the Caucasus and emigrated to Turkey. Possibly as many as 500,000 thus resettled in Asia Minor, Bulgaria, and Serbia. Much of Circassia was depopulated, later to be settled by other Caucasian races and Russians. The remnants of the proper Circassians living in the USSR (1950) number approximately 93,000 people.

ELLSWORTH RAYMOND,
Professor, Soviet Government and Economics,
New York University.

CIRCE, sūr'sē, in classical mythology, a sorceress on the island of Aea. Odysseus (Ulysses) in his wanderings landed on her island and sent Eurylochus with a party to explore the country. They arrived at the palace of Circe, who gave them food and wine and with her magic wand changed them into swine. Eurylochus only, by abstaining from the magic potion, escaped and informed Odysseus of the event. Proceeding to rescue his men, Odysseus met the god Hermes (Mercury), who gave him moly (a herb) to protect him from enchantment. Following the god's advice, Odysseus ran upon Circe with his drawn sword, threatening her with death, compelling her to deliver his companions and to do them no further harm. After living with her for a year and having a son, Telegonus, by her, on her advice Odysseus summoned the shade of the blind seer Tiresias from Hades, to prophesy as to his fate and to receive instructions for his homeward journey. The story is told in the *Odyssey* (q.v.).

CIRCINUS, sūr'sī-nūs (pair of compasses), one of the 14 southern constellations added to the heavens by Nicolas Louis de Lacaille in his posthumous work which appeared in 1763. In the Milky Way it is surrounded by Apus, Musca, Centaurus, Lupus, Norma, and Triangulum Australe. It is inconspicuous, containing only 14 stars visible to the naked eye, the brightest being of the third magnitude.

CIRCLE, sūr'k'l, in *geometry*, a plane figure contained by one line, which is called the "circumference" and is such that all straight lines drawn from a certain point (the "center") within the figure to the circumference are equal to one another. According to this definition of Euclid, which is remarkable for its perspicuity and precision, the circle is the space enclosed, while the circumference is the line that bounds it. The circumference is, however, frequently called the circle. However, no confusion ever arises from this usage.

The properties of the circle are investigated in books on geometry and trigonometry. Properly the curve belongs to the class of conic sections and is a curve of the second order.

The Cartesian equation of a circle with center at the origin and radius R is $X^2 + Y^2 = R^2$. Its polar equation is $P = r$. The general Cartesian equation of a circle is $x^2 + y^2 + ax + by + c = 0$; the general polar equation is $P \sin(\theta + a) = a + bP^2$. From the standpoint of projective geometry, a circle is any conic passing through a certain pair

of imaginary points at infinity, known as the circular points.

The celebrated problem of "squaring the circle" has given rise to extraordinary geometrical labors, and even now there are to be found, as in the case of the problem of perpetual motion, those who profess to have solved it.

The question is to construct by ruler and compasses a square whose area shall be equal to the area of a circle. It is not possible to do so. This was only shown in 1882 by Ferdinand Lindemann. All that can be done is to express approximately the ratio of the length of the circumference of the circle to the diameter and to deduce the area of the figure from this approximation. This ratio, which is known as π , has, however, been determined to a degree of exactness more than sufficient for all practical purposes. If the diameter be called unity, the length of the circumference of the circle is 3.1415926535...; and the area of the circle is found by multiplying this number by the square of the radius. Thus the area of a circle of 2 feet radius is 3.14159×4 , or 12.56636 square feet, approximately.

π can be approximated by infinite series, or by infinite products, or by continued fractions as follows:

$$\begin{aligned}\pi &= 4\left(1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \dots\right) && \text{(Leibnitz)} \\ &= 2\left(\frac{2}{1} \cdot \frac{2}{3} \cdot \frac{4}{5} \cdot \frac{4}{7} \cdot \frac{8}{9} \cdot \frac{8}{11} \cdot \dots\right) && \text{(Wallis)} \\ &= \frac{4}{1 + \frac{1}{2 + \frac{9}{2 + 25} \dots}} && \text{(Brouncker)}\end{aligned}$$

For trigonometrical calculations the whole circumference of the circle is divided into 360 equal parts or arcs, called degrees; each degree is divided into 60 minutes, and each minute into 60 seconds. The angles subtended at the center by these arcs are called respectively degrees, minutes, and seconds of angle. A centesimal system of circular division is sometimes used. For purposes of pure mathematics the unit is the radian, that is, the angle subtending an arc equal to the radius, or $\frac{360^\circ}{2\pi}$. Since every circle

has an equation of the form $P = x^2 + y^2 + ax + by + c = 0$, it follows that if two circles have the equations $P = 0$ and $Q = 0$ (of the same form), if they intersect, the line $P - Q = 0$ will pass through all their finite points of intersection. Even if these points are imaginary, $P - Q = 0$ will be real. $P - Q = 0$ will be in this case the locus of the points from which the tangents to the two circles are of equal length. In either case, it is known as the radical axis of the two circles.

Let us consider the equation of a circle in polar coordinates; it is $\rho \sin(\theta + a) = a + b\rho^2$.

If we substitute $\frac{1}{\rho'}$ for ρ , we get $\frac{1}{\rho'} \sin(\theta + a) = a + \frac{b}{\rho'^2}$. This is also

the equation of a circle. It follows that if we take any circle, such as the unit circle about the origin, and exchange every point for one which is on the same radius vector from the origin, but at a distance from the origin which, when multiplied by the distance from the origin of the first point, gives the square of the radius of the circle, we shall retain all circles unchanged

in form. This transformation is called an inversion. The study of all properties of figures which remain invariant under all inversions is the important branch of mathematics known as inversion geometry. The polar of a point is the line connecting the real or imaginary points of tangency of the tangents to the circle of reference from the point. A point is said to be the pole of its polar.

In practical astronomy, metallic circles accurately divided are used to measure angles. The general principle is to have a telescope moving in a given plane, while a divided circle, situated in a parallel plane, measures the angle through which the telescope moves. Verniers or microscopes are used to read the graduated circle with great precision.

The term "meridian circle" is applied to an instrument in which the telescope revolves in the plane of the meridian, and a divided circle measures angles in this plane.

In logic, a circle is the fault of an argument that assumes the principle which it should prove and then proves the principle by the thing which it seemed to have proved. The same fault takes place in definitions when an idea is defined by others which suppose the knowledge of the first. Arguing in a circle is a fault into which men are very prone to fall, particularly in theological discussions.

In astronomy, the heavens being considered as a spherical surface drawn round the earth as center, an imaginary line drawn round the heavens so as to lie in one plane is a circle of the sphere. It is a "great circle," if the plane of it passes through the center; thus the celestial equator and the ecliptic are great circles; if the plane of the circle does not pass through the center, it is called a "small circle"; all parallels of declination are small circles.

See also GEOMETRY, various subheadings.

CIRCLE, Magic, a space in which sorcerers were wont to protect themselves from the fury of the evil spirits they had raised. This circle was usually formed on a piece of ground about nine feet square (in the East seven feet appears to have been considered sufficient), in the midst of some dark forest, churchyard, vault, or other lonely and dismal spot. It was described at midnight in certain conditions of the moon and weather. Inside the outer circle was another somewhat less, in the center of which the sorcerer had his seat. The spaces between the circles, as well as between the parallel lines which enclosed the larger one, were filled with all the holy names of God and a variety of other characters supposed to be potent against the powers of evil. Without the protection of this circle, the magician, it was believed, would have been carried off by spirits.

CIRCLE OF CURVATURE. When a point in motion is tracing out any curved path, the direction of motion changes from point to point of the curve, and the path is said to be more or less curved according as the direction of the motion of the point changes more or less rapidly. The curvature at any point is measured by the rate of this change at the point per unit length of the curve.

In the case of the circle the curvature is the same at every point; and it is easy to show that the curvature measured as above is equal to the reciprocal of the radius of the circle.

If we consider any small portion of any curve whatever, it may be approximately taken as an arc of a circle, the approximation being closer and closer to the truth as the portion considered is smaller and smaller, and by taking it small enough we may make the approximation as close as we please. The curvature is then the reciprocal of the radius of this circle.

The circle which coincides more nearly than any other with the arc at any point of any given curve is generally found by means of the methods of the differential calculus. Such a circle is called the circle of curvature, and sometimes the osculating circle. The radius of it is called the radius of curvature of the curve at the point considered; and the center of this circle is called the center of curvature. See also CALCULUS, THE INFINITESIMAL.

CIRCLEVILLE, sür'k'l-vīl, city, Ohio, seat of Pickaway County, on the Scioto River at an altitude of 680 feet, 25 miles south of Columbus. It is on a state highway and is served by the Pennsylvania, and the Norfolk and Western railroads. South are the high, fertile Pickaway Plains—corn, hog, and poultry country. Canned vegetables, pork products, and meal are produced and brooms are manufactured. The Public Library Memorial Hall has a miniature of the octagonal Indian mound builders' forts, which became the site of Circleville. In 1810 the city was laid out within the old site on a circular plan, but after a fire in 1841, the city was replotted. The Ohio and Erie Canal, whose old bed can be seen beside the highway, brought prosperity as a shipping point for corn, pork, and lard. It became a city in 1853, and has a mayor and council form of government. Nearby are the sites of Cornstalk town; Camp Charlotte, where Cornstalk, the Shawnee Indian chief, was killed; and Logan Elm State Park, where Logan (q.v.), Mingo Indian chief, uttered his famous lament on the killing of his family. Pop. (1950) 8,723.

CIRCUIT, Electric, a conducting path for electricity, an electric current. In order to use electricity, an outgoing conducting path must be provided from its source to the point where it is to be used, together with a return conductor. These outgoing and return conducting paths form an electric circuit.

There are two fundamental electric circuits: the series and the multiple. A good example of a series circuit is in the small string of lights used for decorating Christmas trees. Here about eight small lights are connected in series. If one light goes out, all lights are extinguished, because the circuit is through each light. A multiple circuit is one where each light is independent of all others. The turning off and on of one light does not disturb the others. The multiple circuit is similar to a ladder where the rungs or steps represent the individual lamps and the side pieces represent the main circuit. The combination is called a multiple circuit. (See ELECTRIC DISTRIBUTION SYSTEMS for diagrams of these and other electrical circuits.)

The term circuit is applied to practically all electrical systems and apparatus. In an electric generator we have an armature and a field circuit; in a transformer, a primary and a secondary circuit; in a relay, a coil or magnetic circuit and a switch circuit. A circuit is said to be closed when an electric current can pass through it. It

is open when the circuit is broken. When a switch is turned on the circuit is closed. Turning off a switch opens the circuit. There are many types of circuits used in every branch of the electrical industry. A short circuit denotes a fault where electricity tends to take a short cut or path in its return to its source. An inductive circuit contains inductance. A two-wire circuit contains two wires or conductors; a three-wire, three conductors; and so on, according to the basic electrical system used. In radio and television many types of circuits are used. The telephone and telegraph systems require many circuits.

For a complete coverage of electric circuits from a technical standpoint, see *Electric Circuits*, by members of the staff of the Department of Electrical Engineering, Massachusetts Institute of Technology (New York 1940).

E. S. LINCOLN,
Electrical Consultant.

CIRCUIT, Judicial, a subdivision of a state or country, effected by constitutional provision or legislative action for the purpose of defining the territorial jurisdiction of its courts; also sometimes called a judicial district or department. State constitutions in the United States generally either divide the area of the state into judicial circuits or confer power upon the legislature to make such a division. A circuit may consist of one or more counties, but does not necessarily coincide with county lines. In the absence of a constitutional restriction, a single county may be divided into two or more circuits. Typical guiding principles in the creation of judicial districts are accessibility and convenience, requiring legislatures to give due regard to the territory affected. Thus the establishment of an unreasonably large circuit, or one which is divided by natural boundaries difficult to traverse, such as rivers, may under some circumstances violate the applicable constitutional provisions. Other constitutional requirements governing the creation of circuits relate to equality of population, extent of territory covered, total number of districts in the state, contiguity of counties in the same district, and the business involved in the districts.

The judicial power of the United States is defined by the Constitution, which vests it in the Supreme Court and in such inferior courts as Congress may from time to time establish. Pursuant to this provision, the United States is divided into 11 judicial circuits, as follows: District of Columbia; first, composed of Maine, Massachusetts, New Hampshire, Puerto Rico, and Rhode Island; second, composed of Connecticut, New York, and Vermont; third, composed of Delaware, New Jersey, Pennsylvania, and the Virgin Islands; fourth, composed of Maryland, North Carolina, South Carolina, Virginia, and West Virginia; fifth, composed of Alabama, the Canal Zone, Florida, Georgia, Louisiana, Mississippi, and Texas; sixth, composed of Kentucky, Michigan, Ohio, and Tennessee; seventh, composed of Illinois, Indiana, and Wisconsin; eighth, composed of Arkansas, Iowa, Minnesota, Missouri, Nebraska, North Dakota, and South Dakota; ninth, composed of Alaska, Arizona, California, Guam, Hawaii, Idaho, Montana, Nevada, Oregon, and Washington; and tenth, composed of Colorado, Kansas, New Mexico, Oklahoma, Utah, and Wyoming. Each of these circuits has a court

of appeals, which serves generally as a tribunal reviewing the decisions of the federal district courts, and in addition as a reviewer of the orders of administrative bodies, when provided by statute.

Prior to the establishment of the modern system of appeals courts for the circuits, there were numerous circuit courts having original jurisdiction of many kinds of suits as well as the power to review cases on appeal from the district courts. These courts were established by various acts of Congress dating from 1789 and were abolished in 1911, at which time one court of appeals was created for each of the then existing nine circuits. In 1929 the eighth circuit was divided and the tenth circuit was formed from states formerly a part of the eighth. The District of Columbia has long been recognized as a separate circuit by the Supreme Court and by many acts of Congress.

RICHARD L. HIRSHBERG.

CIRCUIT RIDER, a traveling preacher, usually of the Methodist Church, who visited rural communities not having a church of their own. His journeys on horseback brought him fairly regularly to a community at expected intervals according to the amount of territory to be covered. He had to be a good preacher, accustomed to hardship and outdoor life, ready to preach in any sort of building, even a tavern or a barn. Originating in England with John Wesley in the 18th century, the circuit rider came to be a typical feature of early frontier life in the United States.

CIRCULAR NUMBERS, numbers whose powers end on the same figure as they do themselves: such are numbers ending in 0, 1, 5, 6.

CIRCULAR PARTS, Napier's Rules for. Invented by John Napier (q.v.), the inventor of logarithms, these rules are for the solution of all cases of right-angled spherical triangles, and were first published in his *Mirifici Logarithmorum Canonis Constructio* (1619). See TRIGONOMETRY.

CIRCULAR POLARIZATION OF LIGHT. See POLARIZED LIGHT.

CIRCULARS AND CIRCULARIZING.

Among the techniques of marketing products and services, the distribution of printed matter devoted exclusively to promoting the product is one of the oldest and most successful. The first printed advertisement in English was a circular—William Caxton's broadside (1477) announcing the publication and sale of a book on conducting religious services. The distribution of public notices and shop bills was common long before the rise of newspaper advertisements. Direct distribution of advertising matter, by hand, door-to-door, or at the point of sale, is widely used; but since the mid-19th century, the use of public carriers, such as the mails, has become the major means of circularizing. The adoption of low postal rates for third-class matter made this technique economically feasible. In the United States, direct mail advertisement is the second largest medium in dollar volume, for over \$1.1 billion (15 per cent of the total) was spent in 1952.

The post office defines a circular as "a printed letter sent in identical terms to several persons." It thus includes form letters, folders, throwaways,

self-mailers, booklets, letters with novelty "gimmicks," price lists, and catalogues, varying in style from elaborate multicolored brochures to simple mimeographed announcements. A unique extension of the mailed circular is the circularized telegram.

Circularizing constitutes the basic marketing method for many businesses, notably the great mail-order houses, which post millions of circular letters each year in addition to their gigantic catalogues. Almost every product is sold through the mail: books, household articles, and industrial equipment. The essential advantage of the mailed circular is that it reaches a segregated, specialized market; the direct distribution of handbills and leaflets, on the other hand, works on a saturation basis.

CIRCULATION, sūr-kū-lā'shūn, passage in a circle, as the circulation of the blood. The term circulatory system is a general one for a group of organs carrying fluids or semisolids from one part of the body to another, the matter being of a nutrient nature. In the case of the blood the system is composed of the deep circulation (heart, great vessels, brain, abdominal organs, and limbs) and the superficial or lesser circulation (superficial tissues such as are in or under the skin). The systemic or general circulation is distinguished from the pulmonary circulation. The lymphatic circulation is connected with that of the blood. All animals, even unicellular ones, have a circulation even if only a single alimentary tube. In plants the circulation is by means of the sap. See also ARTHROPODA; BLOOD; CRUSTACEA; PROTOZOA; SAP.

HAROLD WELLINGTON JONES, M.D.,
Editor, "Blakiston's New Gould Medical Dictionary."

CIRCUMCISION, sūr-kūm-sīzh'ūn, an amputation of the foreskin or of the *labia minora* of the human organs of generation; principally performed on males, but sometimes on females. It has been practiced in all ages and by both civilized and savage races, as Arabs, certain African tribes, Christian Abyssinians, Australian "blacks," Malays, some North American Indians, Aztecs, Mayas, Caribs, South American Indians, Jews, Mohammedans, Fijians, and Samoans.

In the male, the operation consists in removing a section of the prepuce. The original object was religious and symbolic, and its antiquity is lost in the shade of mythology. The institution of the rite among the Jews is recorded in Genesis 17:9-27. Here it is stated that Abraham, then 99 years old, was circumcised, with his son Ishmael, 13 years old, "and all that were born in his house and all that were bought with his money, every male among the men of Abraham's house." But by the terms of the covenant every male among the Hebrews was to be circumcised on the eighth day after birth, and this rule, peculiar to the race, is observed with such rigor that even the Sabbath observances are not allowed to interfere with the ceremony. Other Eastern nations have practiced circumcision on various days—the Arabs 7, 14, 21, or 28 days after birth, though Josephus states that in his day the Arabs circumcised after the age of 13 because the circumcision of Ishmael, their progenitor, occurred at that age; the Mohammedans of Persia circumcise in either the third or fourth year; the Fijians and the Samoans in the

seventh year; the Christian Abyssinians in the sixth, seventh or eighth year; while some of the African tribes that practice the rite follow the Jewish rule; others, again, performing the ceremony between 30 and 60 days after birth.

Circumcision is universally practiced by Mohammedans, not on the authority of the Koran, which does not enjoin it, but as following the example of Mohammed. It seems to be doubtful whether Mohammed's omission to prescribe the rite was due to his deeming such a rule valueless where custom already decreed it, or because he attached only a physiological and not a religious importance to the ceremony. It is, however, now recognized as a religious obligation just as strongly as if it had been ordained by the founder of Islam. Circumcision among Mohammedans may be practiced seven days after birth, but it is customary to postpone the ceremony to some time between the 7th and 12th year.

Christianity recognizes no religious significance in the rite, substituting for it, according to Saint Paul (Rom. 2: 25-29) "circumcision of the heart."

Circumcision of proselytes to the Jewish or Mohammedan faith is insisted on by the orthodox, and previous circumcision for surgical reasons is not accepted as sufficient compliance with the requirements of religion. Among some "reformed" Jews, however, the circumcision of adults has lately been abandoned. Among many savage tribes the rite is undergone at the age of puberty and is perhaps in such instances more of a sociological than a religious ceremony, being akin to other mystic rites which mark the entrance of the young into full tribal fellowship.

The inner significance of circumcision is psychological. It is a purely symbolic rite, the origin of which is lost for the conscious life of the individual. It has no intrinsic medical value whatever, save where some maldevelopment is present. The motive of cleanliness is solely a rationalization to endeavor to explain its deeper psychological significance as a type of racial identification and an index of the father fixation fantasy in the unconscious. The operation is sometimes attended with grave consequences, hence should be done by surgeons only.

CIRCUMFERENCE, or **PERIPHERY**, the curve which encloses a circular, elliptic or other plane area. In figures bounded by straight lines, as the triangle, square and polygon, the term perimeter is employed to designate the sum of all the bounding lines taken together. The length of the circumference depends partly on the nature of the curve; thus, that of the circle of radius r and diameter $d = 2\pi r = \pi d$, where $\pi = 3.141592 \dots$ and that of the ellipse =

$$2\pi a \left\{ 1 - \left(\frac{1}{2} \right) \frac{e^2}{1} - \left(\frac{1.3}{2.4} \right) \frac{e^4}{3} - \left(\frac{1.3.5}{2.4.6} \right) \frac{e^6}{5} - \dots \right\}$$

where a is the semiaxis major, and e the eccentricity. See also **CIRCLE**.

CIRCUMFLEX, in grammar, one of the three accents, formed by the union of the other two, thus $\acute{\circ}$, $\grave{\circ}$. It originally denoted a rising and falling of the tone in the pronunciation

of the syllable. In Greek it is used in certain cases to indicate the long vowel of the last syllable or of the penult. In Latin the mark is Λ . It is not used in English, and in French is usually a sign of the elision of a letter, often the letter s , and therefore indicates a prolonged sound.

CIRCUMNAVIGATION OF THE WORLD. See **AROUND-THE-WORLD RECORDS**.

CIRCUMNUTATION, the continuous motion of every growing part of a plant, in which it describes irregular elliptical or oval figures. The apex of the stem, for instance, after pointing in one direction, moves round till it points in the opposite direction and so on continuously. The term circumnutation was first used by Darwin.

CIRCUMPOLAR STARS, stars near the Pole that appear to move around it, and perform their circles without setting. A star whose polar distance is less than the latitude of a place in the same hemisphere will never set at that place. If the place is in the other hemisphere it will never rise. They are constantly used by astronomers in connection with meridian work for determining latitude of a place or the azimuth of a line. The pole-star Polaris or Alpha Ursae Minoris, usually known as the North Star, is the most used for that purpose.

CIRCUMSTANTIAL EVIDENCE, evidence which tends to prove a particular fact by the proof of other facts, from which it is concluded that the particular fact must have happened. It is the natural and reasonable inference resulting from facts which have been established.

If A is on trial for the murder of B, and a witness testifies that he saw A shoot B, and a few minutes later B died, that would be direct evidence; whereas if the witness testified that B had been shot and the bullet found in the body of B was of a particular make only used by A and that A was in the neighborhood at the time of the shooting, the jury might infer that A was guilty; but if A could prove that his pistol had been stolen from him shortly before the shooting and he had not recovered it at the time of the shooting, it would be a complete defense and the verdict would depend on the credibility of the witnesses.

Circumstantial evidence is of two kinds: that from which a certain conclusion necessarily follows and that from which a certain conclusion is only probable or likely. If the body of a man is found with a bloody right hand impression on a part of his body where it is impossible for him to put his right hand, the presumption is that some one was present at or since the time the person was hurt; but if that is all of the evidence, it is impossible to tell whether the bloody impression was made by the person at the time of the assault, or by some one after the assault had been committed. In civil cases the jury may decide according to the weight of the evidence; but to convict a person of a crime the evidence must be such as to leave no reasonable doubt as to his guilt. See **CRIMINAL LAW**.

CIRCUMVALLATION, a fortification consisting of a parapet of earth and a trench, constructed by a besieging army around its camp, to guard against attempts to relieve the place besieged.

CIRCUS. A Latin word used by pre-Christian Romans to denote the circuit made by racing chariots. Eventually it denoted the rectangular, oval or circular enclosure where Roman sports and pastimes were sponsored by Roman rulers for the entertainment of their, perhaps restless, subjects. For centuries these politically inspired athletic and wild animal performances were given to vast audiences of Roman subjects in Italy, Gaul, England and other parts of the Roman Empire. Better known of these circus enclosures was the Circus Maximus, an amphitheater 625 feet wide, 1,875 feet long with rounded ends. From both ends and from one side rose tiers of seats from which 260,000 spectators could cheer the winners of the races, gladiatorial combats, or the slaughter of defenseless Christians by Numidian lions. As an added attraction, the Roman Caesars built a canal or waterway inside the enclosed area and thus offered aquatic contests as well as ground acrobatics and wild animal exhibits.

Most imposing of the Roman amphitheaters was the Colosseum adjoining the Forum, erected of stone by Emperors Vespasian and Titus during the first Christian century, for the accommodation of 50,000 spectators on its soaring tiers of seats.

During the 15th and 16th centuries the Roman chariot races and athletic contests, the trained animal shows characteristic of fairs, and the buffoonery of white-faced clowns merged into the traveling or semipermanent European circus featuring equestrian performances and clowning. Given in taverns or coach yards to the music of fife and drum, rewarded by collections of coppers, these persistent groups struggled across Europe until a retired British soldier "Mr. Astley, Sergeant-Major in His Majesty's Royal Regiment of Light Dragoons" established himself as a trick horseman in a wooden building near the Half-Penny Hatch Inn, London, in the 1770's. That father of the modern circus was followed by the Franconi's of Italy and France and by John Bill Ricketts who came to America to run a riding school and who rode for pleasure with Gen. George Washington. Thus Philip Astley, the Franconi's, John Bill Ricketts and other hard working performers and animal trainers, laid the foundation for America's rolling shows, little families or groups of acrobats and clowns who toured the eastern United States by horsepower, performing inside a roofless canvas wall, weather permitting, during the 1820's.

By the 1830's a hustling Yankee named Phineas Taylor Barnum had started out from Connecticut as a "rolling showman" with a canvas-topped tent. Arriving in each village in the early morning, performing afternoons and evenings if possible, tearing down and packing up, driving to the next likely hamlet, the rolling shows made adventurous history for circusmen.

Barnum, amassing some money by lecturing and by exhibiting a midget billed as Tom Thumb, found himself eventually part owner of Barnum & Bailey's Greatest Show on Earth, boasting the world's greatest collection of elephants and other animals, giving performances in three rings enclosed by a hippodrome track and seating ten

thousand applauding and money-paying customers, under the "big-top."

In performance, physical planning, costuming and effect it was a combination of the Circus Maximus and the Colosseum brought down to date, except that it moved about the country in its own railroad cars with its canvas city owned and managed by citizens rather than by their rulers.

One of those husky competitors was a family of seven Ringling Brothers from Baraboo, Wis. By 1890, the Ringling Brothers circus was Barnum & Bailey's biggest rival. When Bailey died in 1906, the "busy brothers from Baraboo" paid \$410,000 for the Barnum & Bailey Circus title and property. When "Mr. John" Ringling, last of the Ringling Brothers, died in 1936 he left not only the ownership of the Ringling Brothers, and Barnum & Bailey Combined Shows — The Greatest Show on Earth. He also left six other large circuses which he had acquired by purchase.

In 1950, the Ringling-Barnum Circus was on tour on a hundred, all-steel, circus-owned, double-length railroad cars. It owned more than thirty elephants as features of its menagerie. It seated 10,000 in its main tent or "big-top," and it was owned by the Ringling Family, John Ringling North as president; Henry Ringling North as vice president. In spite of steadily increasing competition from motor cars, airplanes, motion pictures, radio and video, American circuses exhibit to more than 20,000,000 customers, annually.

EARL CHAPIN MAY.

CIRENCESTER, sî'rên-sēs-tēr, England, town in the county of Gloucester, on the river Churn, 17 miles southeast of the city of Gloucester. The chief industries are malting, brewing and cutlery manufacture; it also has a large wool trade. The town contains the remains of the gateway of an abbey founded in 1117 and several churches of interest. In the environs is the well-known Royal Agricultural College, with a large number of students coming from all parts of the world. It is an important live stock and wool market. Cirencester was founded by the ancient Britons, and later, under the name of Corinium, became a Roman station. Various Roman remains, including those of an amphitheater, have been discovered in it, and numerous relics belonging to this period of its history have from time to time been discovered. Pop. (1938) 7,209.

CIRILLO, chē-rēl'lo, **Domenico**, Italian physician, republican, and naturalist; b. Grugno, Naples, 1734; d. Naples, Oct. 29, 1799. He officiated in early life as professor of botany, travelled to France and England, became a fellow of the Royal Society of London, a friend of Buffon, D'Alembert and Diderot, and on his return to Naples was appointed physician of the court. After the proclamation of the republic by the French, he was chosen representative of the Neapolitan people, and member of the legislative commission (1799); and on the re-establishment of royalty suffered death on the scaffold, rather than take the oath of allegiance or ask a pardon from King Ferdinand. His principal writings are *Fundamenta Botanica* (1787); and *Entomologiae Neapolitanæ Specimen* (1787).

CIRPAN, chîr-pân', a town of eastern Rumelia, Bulgaria, on the tributary of the Maritza,

40 miles east of Plovdiv. It is situated in a fertile, fruit-producing region and is noted for its mineral springs. Pop. about 12,000.

CIRQUE, *sûrk*, a broad amphitheater-like valley head, also sometimes called a glacial bowl. It is usually the gathering ground for the snow and névé that form the glacier. Cirques usually have steep rock walls and are often occupied by small lakes. They constitute a striking feature of mountain landscapes in glaciated regions. As the bergschrund crevasse is formed at the head of the glacier, where the ice pulls away from the rocky walls, these walls are exposed to frost work, which loosens large blocks of rock. Each winter, with the accumulation of new snows, these loosened blocks freeze into the glacier and are dragged away down the valley. Thus the valley head grows until a cirque is formed. See **BERGSCHRUND**.

CIRRHOISIS. A chronic progressive inflammatory disease of the liver. It is characterized by an overgrowth of connective tissue and by degeneration of cells of the parenchyma in some areas with regeneration in others. The disease is known also as biliary cirrhosis and exists in two forms, the primary (Hanot's cirrhosis), which is rare, and secondary or obstructive cirrhosis. The latter follows persistent obstruction of the common bile duct. It is accompanied by jaundice and is most often caused by cancer of the head of the pancreas. Next in order is inoperable obstruction of the common duct or extensive involvement of the duct in scar tissue from adhesions. The liver is usually enlarged. Sometimes the condition can be relieved surgically by removing the biliary obstruction. The disease is also caused by syphilis and this form may be alleviated by antisyphilitic treatment. There is not much evidence to support the view that cirrhosis is caused by alcohol. The term cirrhosis is sometimes applied incorrectly to indicate kidney disease and also lung fibrosis. The prognosis in cirrhosis is extremely variable. It will depend somewhat upon the type and whether or not the cause is removable. Complete recovery cannot be expected. See **LIVER**.

CIRRIPEDIA, an order of entomostracous Crustacea (barnacles), sometimes ranked as a subclass, always fixed in the adult stage, but with free-swimming larvae having three pairs of appendages (*nauplius*) like other Crustacea. The typical barnacles have the body enclosed in a reduplication of the skin which secretes a calcareous shell, on which account they were classed with the Mollusca until the discovery of their free-swimming larvae led to a closer investigation of their structure. Owing to adaptation to a sedentary life segmentation of the body has become obscure, and the six pairs of jointed biramous appendages are mere fringed scoops for creating currents in the water. The eyes and other sense organs have likewise degenerated, and most species are hermaphroditic. The barnacles are exclusively marine, and a great many are parasitic.

Four suborders are distinguished: (1) Thoracica, including the typical, free-living, shelled barnacles of which the sessile forms (*Balanidae*, *Coronulidae*, etc.) are well known as rock and ship barnacles in which the animal is pro-

tected by a conical shell formed of several pieces, with a multivalve conical movable lid, having an opening through which several pairs of long, many-jointed, hairy appendages are thrust, thus creating a current which sets in toward the mouth. The young have oval bodies, with a single eye, a pair of antennae, with three pairs of legs. After swimming about for some time it attaches itself by its antennae to some object, and now a strange backward metamorphosis begins. The body becomes enclosed by two valves, the stalk by which it is anchored grows larger, the feet become more numerous and eventually the barnacle shape is attained. The goose barnacle (*Lepas*) is not sessile, but is flat and triangular, and attached to floating bits of wood or seaweed by a long, large, soft stalk. (2) Abdominalia, parasitic barnacles, in which the sexes are separate and very unequal in size. In this group is presented the remarkable phenomenon of dwarfed complementary males discovered by Darwin. The females live in burrows in the shells of mollusks and other barnacles, while the males are minute, lack mouth, digestive canal and appendages, and live, often several together, permanently attached to the female. (3) The Apoda, whose body is maggot-shaped, are hermaphrodite and parasitic in other barnacles. (4) Rhizocephala: This group presents perhaps the most extreme cases of degeneration, through parasitism, known among animals. *Sacculina*, which attaches itself to the abdomen of the crab, is little more than a bag of genital organs which draws its nourishment from the tissues of its host by means of branching rootlike processes which penetrate to every part of its body.

CIRRUS. See **CLOUDS**.

CIRRUS, in botany, the tendril by means of which certain plants climb, usually a modified leaf or the prolongation of a midrib.

CIRSIIUM, a genus of plants belonging to the family Asteraceae, generally known as thistles, common in most temperate regions. Many of them are troublesome weeds. Among the more common of them are *C. arvense* (corn-thistle, way thistle or creeping thistle), which has strong fleshy roots extending underground, and is difficult of extirpation; and *C. lanceolatum* (spear thistle), which, both from its size and rough feeding, is a great robber of the soil, but being only a biennial is more easily managed.

CIRTA, *sûr'tà*, city, northern Africa, the capital of the Numidian prince Syphax, and an important fortress of Masinissa and his successors. Later it became a flourishing Roman colony. It was much injured by the troops of Maxentius in 310 A.D., but was restored by Constantine and named Constantina. The modern Constantine (q.v.) in Algeria occupies its site.

CISALPINE REPUBLIC, former state, Italy, located in the northern part. After the Battle of Lodi, May 10, 1796, Gen. Napoleon Bonaparte proceeded to organize two states—one on the south of the Po, the Cispadane Republic, and one on the north, the Transpadane. These two were united into one on July 9, 1797 under the title of the Cisalpine Republic, which embraced Lombardy, Mantua, Bergamo, Brescia, Cremona, Verona and Rovigo, the duchy of Modena, the

principalities of Massa and Carrara, and the three legations of Bologna, Ferrara and the Romagna. The nominally independent republic had an area of more than 16,000 square miles, and a population of 3,500,000. The seat of the government or directory was Milan. The army consisted of 20,000 French troops, paid by the republic. The republic was dissolved for a time in 1799 by the victories of the Russians and Austrians, but was restored by Bonaparte after the victory of Marengo and some modifications of constitution were made and the area was increased. In 1802 it took the name of the Italian Republic, and chose Bonaparte for its president. In 1805 the republic sent a deputation to Napoleon with authority to give him the title of king of Italy. The territory was known as the kingdom of Italy until 1814. In 1815 it became a part of Austria. Its former territories are now in Italy.

CISCO, sīs'kō, city, Texas; in Eastland County; 40 miles east of Abilene; altitude 1,608 feet. It is served by the Texas and Pacific and the Missouri-Kansas-Texas railroads, and has an airport. Cisco lies in a region which grows livestock, peanuts, and fruits, and has large petroleum and natural gas reserves. The city manufactures work gloves, hydrocarbons, oilfield supplies, and brooms. Lake Cisco, formed by a dam five miles north, provides water and is a recreation center. Cisco was founded in 1881, was incorporated in 1883, and again in 1919. Pop. (1950) 5,230.

CISCO, sīs'kō, a name applied to over twenty of the species and subspecies of *Leucichthys*, a genus of the whitefish family, Coregonidae. The various ciscoes are usually described by a locality name, such as Twin Lakes cisco and Lake Superior cisco, and by such names as tullibee, chub, bluefin or blackfin. These fishes, like the salmon and trouts, have an adipose dorsal fin, but the scales are larger and the mouths are smaller than those of the Salmonidae. Most of the ciscoes belong to the species *artedii*, or one of its subspecies. The genus is the same as the chubs, which they resemble, but which are smaller, on the average. They live in the clear cold waters of northern North America and Eurasia, but their greatest concentration is in the Great Lakes region. They are caught commercially, and large numbers are eaten fresh, smoked, or salted.

Consult Koelz, W., "The Coregonid Fishes of North-eastern North America," *Papers, Michigan Academy of Science, Art and Letters* (Ann Arbor 1930); Hubbs, C. L., and Lagler, K. F., *Fishes of the Great Lakes Region* (Bloomfield, Mich., 1947).

CISNEROS BETANCOURT, sīs-nā'rōs bē-tān-kōort', **Salvador**, Cuban patriot and statesman: b. Puerto Príncipe (now Camagüey), Feb. 10, 1828; d. Feb. 28, 1914. A descendent of a family of the Spanish nobility, with the hereditary title of marqués de Santa Lucía, he nevertheless joined the party of Cuban independence as a youth, being active in various revolutionary organizations in Camagüey. Upon the outbreak of the Cuban revolution of 1868-1878 led by Carlos Manuel de Céspedes, Cisneros joined the insurgents, and succeeded Céspedes as president of the revolutionary government in 1873-1874, but soon relinquished the post. Cisneros was also president, 1895-1898, of the revolutionary

government which was victorious upon the intervention of the United States and the outbreak of the Spanish-American War. After 1898 Cisneros was a senator from Camagüey.

CISPADANE, sīs'pā-dān, **REPUBLIC**, a nominally independent republican state established by Napoleon in Italy in 1796 after the Battle of Lodi. It comprised Bologna, Modena, Ferrara, and Reggio. In 1797 it was united with the Cisalpine Republic (q.v.).

CISPLATINE, sīs-plā'tin, **REPUBLIC**, the name by which Uruguay was known from 1828, when it became independent of Brazil, until 1831. Previously, from 1821 until the revolution of 1825-1828, it had been the Cisplatine Province of Brazil.

CISSAMPELOS, sīs-ām'pê-lōs, a tropical genus of climbing shrubs of the natural order Menispermaceae, whose growth is similar to that of an ivy vine. The plant is of great commercial value because of its medicinal qualities, especially the velvetleaf of Brazil (*Cissampelos pareira*), the root of which supplies the spurious pareira brava, abuta root, used in medicine as a tonic. Other species growing in nearly all tropical countries are used for emetics and cathartics and an East Indian species (*C. oblecta*) yields an intoxicating spirit.

CISSEY, sē-sā', **Ernest Louis Octave Courtot de**, French general: b. Paris, Sept. 23, 1810; d. there, June 15, 1882. He was educated at the military school of Saint Cyr and having served with distinction in Algeria and the Crimea, he was promoted general of division in 1862. He fought in the Franco-Prussian War and against the Commune of 1871. He was elected to the National Assembly in February 1871 and was minister of war from 1871 to 1873 and in 1874-1876. He was elected life senator in 1875.

CISSOID, a curve in geometry, the locus of the vertex of a parabola rolling upon an equal parabola. If pairs of equal ordinates are drawn to the diameter of a circle, and through one extremity of this diameter and the point in the circumference through which one of the ordinates is let fall a line is drawn, the locus of the intersection of this line and the equal ordinate is known as the cissoid. This curve was discovered by Diocles while he was seeking the solution of the celebrated problem of the duplication of the cube.

CIST, **Henry Martyn**, American soldier: b. Cincinnati, Ohio, Feb. 20, 1839; d. Rome, Italy, Dec. 17, 1902. He graduated at Belmont College 1858 and began the study of law, but enlisted as a private in the Sixth Ohio Regiment in 1861, attaining, before his resignation in 1864, the brevet rank of brigadier general. He was post adjutant of Camp Chase during the imprisonment of the Confederates captured at Fort Donelson, assistant adjutant general of the Army of the Cumberland and later on the staff of generals Rosecrans and Thomas. After the war he practised law in Cincinnati, was twice mayor of College Hill, originated the project that resulted in the conversion of the Chickamauga battlefield into a national park and was a contributor of military articles to the maga-

zines. He wrote *The Army of the Cumberland* (1882) and collaborated with Donn Piatt in a *Life of General George H. Thomas* (1892).

CISTACEAE, sîs-tă'sê-ê. See CISTUS.

CISTERCIANS, sîs-têr'shāns, -shî-āns, a monastic order—because of their robes also called **GREY or WHITE MONKS**—founded by St. Robert de Molesme who in 1098 established a community at Cîteaux dedicated to the literal observance of the rule of St. Benedict (q.v.). It was above all the prudence and zeal of the third abbot of Cîteaux, English-born St. Stephen Harding (d. 1134), that made possible the expansion of the struggling community into a vigorous new order. Under his rule the first four daughter houses of Cîteaux (La Ferté, Pontigny, Clairvaux, and Morimond) were established between 1113 and 1115, and in 1119 he drew up the *Carta Caritatis*, a code of statutes for the government of the whole order.

The subsequent rapid expansion of the Cistercians was inspired largely by the genius of St. Bernard (See **BERNARD OF CLAIRVAUX**), who joined the order in 1112. At his death in 1154 there were some 280 abbeys, and by the end of that century some 530, over 60 of them in England and Wales.

The Cistercian life was one of poverty, prayer, and arduous labor. There were long fasts and little sleep. Golden ornaments and rich cloths were banished from the altars and the churches themselves were unadorned with sculpture and painting. In aiming at the utmost simplicity, the Cistercians in fact achieved a very pure and beautiful style of architecture; the best surviving example is at Pontigny.

Apart from the austerity of the monks' lives, the Cistercian Order differed from the older forms of Benedictine monasticism in both its constitutional structure and its economic organization. Each house elected its own head but was subject to visitation by the abbot of the founding house, while all the abbots of the order met together once a year in General Chapter. (Cîteaux itself was visited by the abbots of the first four daughter houses.) The monasteries were supported, not by endowments of rents from productive estates, but by the labor of the monks themselves and often undertook the cultivation of great tracts of waste land. To help with this work, and to provide a form of religious vocation for the illiterate peasant, a numerous class of lay brothers was recruited. Through their agricultural activities the Cistercians came to play an important part in the economic life of medieval Europe, especially in the growth of the English wool trade and the opening up of arable land in eastern Europe.

By the middle of the 13th century, however, there were signs of decline from the fervent zeal of the early days, and the circumstances of the 14th century, with its war, plague, and schism, hastened the process of decay. In the later Middle Ages there was a general relaxation in standards of austerity, but also repeated attempts at reform, one of the most notable being that of the Abbot De Rancé of La Trappe (q.v.) in the 17th century. The Protestant Reformation and later on the upheavals of the French Revolution brought about a suppression of nearly all the Cistercian houses in Europe, but during the 19th century there was a substantial revival. In

1892 the order was divided into two observances, the Cistercians of the Common Observance and Cistercians of the Strict Observance, the latter formed by a union of several Trappist congregations. By the middle of the 20th century there were over 3,000 Cistercian monks of the Strict Observance and nearly 1,000 of the Common Observance. There are six Cistercian abbeys in the United States and six in the British Isles.

Consult Janauschek, P. K., *Originum Cisterciensium Tomus I* (Vienna 1877); Guignard, P., *Monuments primitifs de la règle cistercienne* (1878); Vacandard, E., *Vie de S. Bernard*, 4th ed. (1910); Coulton, G. G., *Five Centuries of Religion* (Cambridge, Eng., 1923-50).

BRIAN TIERNEY,
Catholic University of America.

CISTUS, sîs'tûs, or **ROCKROSE**, a genus of low evergreen flowering shrubs belonging to the family Cistaceae. Its 20 species occur naturally in the Mediterranean region, and some species and hybrids are cultivated as ornamentals in the warmer parts of North America. The rose-like flowers are characterized by five white, yellow, pink, or purple petals, and numerous yellow stamens. The juice of the leaves and stems of several species (*C. ladaniferus*, *C. villosus*, *C. laurifolius*) yields labdanum (ladanum), a resinous substance formerly used in medicine and now used in the perfume industry.

CITADEL (from the Italian *cittadella*, signifying "little city"), a kind of fort, consisting of four, five, or six sides, commonly erected on commanding eminences within towns. It is distinguished from a castle by having bastions.

CITATION, a bay thoroughbred colt, foaled in 1945, that was bred by Warren Wright at Calumet Farm. Citation was sired by Bull Lea out of the dam Hydroplane II, whose sire was the English stallion Hyperion. One of the all-time "greats," he was pronounced Horse of the Year in 1948, after he had won the triple crown: the Kentucky Derby, Preakness, and Belmont Stakes. During his four seasons of campaigning he won eight out of nine starts as a two-year-old, 19 out of 20 as a three-year-old, and out of his entire racing career of 45 starts, he was first 32 times, second 10 times, third twice, and he won altogether \$1,085,760. He was retired in 1951.

CITATION, *in law*, a court order to appear; the act of quoting an authority to support a legal argument, or the authority so quoted. In its first sense, citation is substantially the equivalent of summons, denoting a writ or other formal process judicially issued, commanding appearance in court at a specified time to answer a petition or complaint, or for some other particular purpose. In its second sense, the term refers to the reading, production of, or reference to legal authorities and precedents, or to the material so read, produced, or referred to.

In *military* and *social usage*, citation denotes a specific mention for gallantry or merit in military orders and dispatches, as well as in the conferring of an honorary academic degree.

CITHARA, sîth'à-râ, a guitarlike musical instrument, said to have been invented by Apollo. The strings, usually five or six in number, were struck with a plectrum, or picked with the fingers. It was the forerunner of the banjo, guitar, zither and similar instruments. See **LYRE**.

CITIES OF REFUGE. According to the law of Moses, six out of the 48 cities which the Israelites were directed to give to the tribe of Levi, in the division of the land of Canaan among their tribes, were to be set apart as cities of refuge for those who were guilty of unintentional murder. The right of avenging murder belonged to the next of kin of the murdered man; but the slayer fleeing to one of these cities, the avenger was forbidden to touch him until he stood judgment, when, if he were found to have acted without premeditation or malice, he had a residence appointed him in the city of refuge until the death of the high priest, and was then permitted to return to his inheritance. If the slayer violated this regulation by leaving the city of refuge before the death of the high priest, the avenger might kill him with impunity. The six cities of refuge were Kedesh, Shechem and Hebron on the west side of the Jordan; and Bezer, Ramoth-Gilead and Golan on the east.

CITIZEN OF THE WORLD, the signature of Oliver Goldsmith's *Letters from a Chinese Philosopher residing in London, to his friends in the East*. The work was published in 1762.

CITIZENSHIP. Political Citizenship.—A citizen is commonly defined as one who owes allegiance to a government and who is entitled to protection by that government. At least four concepts seem to characterize the relationships between the individual and the community which are designated as citizenship. Each of these contains a group of theories, rules, and arrangements. These four areas of concern are: membership in the socio-political group; freedom of individual action; protection of person and property, in some instances even from the state itself; and responsibility of the individual to the group.

When and where did these ideas of citizenship develop? The rise of city-states and the surge of nationalism which followed in Europe during the 17th and 18th centuries led political leaders to institute programs and promulgate legislation which would foster traditions of civic allegiance on the part of the populace. During the same period emerging economic practices required protection for citizen capitalists. Such practices, however, were based in part upon the writings of the moral philosophers, from the Stoics to Jean Jacques Rousseau, who had long propounded ideals which called for the development of individuals who possessed the attributes of free, democratic citizens. Other principles of citizenship can be traced back to the Hebraic-Christian tradition; medieval western man had been influenced to serve as a universal citizen in Christ. Practices of feudal barons and their liege subjects were forerunners of citizenship aspects concerning service to the state in exchange for protection, as well as being forerunners of citizenship aspects concerning the varied rights of community membership.

More often, the American and French revolutions are cited as progenitors of the modern theory of citizenship. In the light of the history of the evolution of government, ideas of citizenship are of comparatively recent origin, since most citizenship definitions include specifically the inherent right of the individual to partake in the government. Such a description of the citizen eliminates a number of the members in many political communities. In ancient Greece the citi-

zens were an elite group; in Rome, until the establishment of empire citizenship about 200 A.D., the prerogatives and duties of the citizens marked them apart from the masses. In most modern states, slaves and other individuals without rights have largely disappeared; but we continue, in a legal sense, to need and use other categories besides that of citizen for individuals who have limited rights in a particular nation.

The term "subject" is sometimes used for persons with restricted franchise. Residents of colonies or territories may be so designated. The term has not found favor because of its association with theories of absolutism. In some instances the term "ward" is used instead of "subject." States having popular forms of government and peoples who disfavor the monarchical type of government have tended rather to use the term "national" for persons who owe allegiance to a state but do not enjoy the full rights and privileges in that country. For example, although qualified in all other ways for citizenship, a member of a dependent tribe may be denied the right to vote. In American Samoa, unless a native has one parent who is a citizen of the United States, he is designated as a national of the United States and enjoys no voting privilege.

The term "alien" refers to a person residing or traveling in a state who owes allegiance to and is a member of another nation. His rights and duties have been fixed by international law, by treaties between different states, and by the statutes of the state in which he is living temporarily. Aliens are expected to obey the laws of the host state. In the United States, aliens are entitled to the protection of life and property. They may work and earn compensation, send children to public schools, and have the use of the courts. However, they may be denied the right to buy land and the right to draw workers' benefits, and cannot vote. Aliens have been required to register in the United States, but there is no exact count. During the harvesting season, the total number of aliens in the United States has been estimated to rise above 5 million.

The term "declarant" is often used to designate an alien who has initiated the process of acquiring citizenship in the host state. His rights depend upon the laws of the given state; usually a person who indicates such intentions will gain the protection of the host country while remaining within its boundaries. Should such an individual return to the nation in which he has renounced citizenship, he cannot expect protection by either state. Such a person, commonly called an expatriate, can be seized by officials in his original state, which may not have recognized his right to change citizenship, and he may be faced with charges of back taxes or unfulfilled military duty.

Citizenship in a state may be acquired in a number of different ways. The most frequent means is by virtue of either the parentage or the place of birth. The next most common method is by the process of naturalization, whereby aliens may acquire citizenship when formally granted by a state.

The two principles related to descent or place of birth are frequently in conflict. The oldest of these is known as the *jus sanguinis* (law of the blood) which was a feature of Roman law and has become the most dominant. It is now accepted by the majority of nations, usually in some combination with the second practice. Under *jus sanguinis* the offspring gains the nation-

ality of one or both parents. The *jus soli* (law of the soil) principle rose during the feudal period, which emphasized the import of the idea of territorial sovereignty; here the place of birth, regardless of parental citizenship, becomes the decisive factor. A recent survey revealed 17 nations basing their nationality laws solely upon *jus sanguinis*, 25 principally upon *jus sanguinis*, and 2 equally upon *jus sanguinis* and *jus soli*, with 26 other countries basing their citizenship laws principally upon *jus soli* and partly upon *jus sanguinis*.

The United States follows the method of *jus sanguinis* only in part. Any person born of parents who are both citizens of the United States and one of whom has resided in the United States is automatically a citizen, irrespective of his place of birth. In cases of birth outside of the United States, when one parent is not a citizen, the child, to become a citizen, must live in the United States for five years between the ages of 13 and 21. On the other hand, following the method of *jus soli*, the United States recognizes as American citizens all persons born in the United States, except the children of foreign diplomats. Here the law of the soil supersedes the law of the blood and, for example, a child of two Japanese aliens born upon American territory is recognized as a citizen of the United States.

The United States had no national laws concerning citizenship until after the Civil War. From the inception of the government in 1788, the United States had accepted English common law, the laws of the several states, and the place of birth as determining factors. Some conflicts were resolved by court decision and by the secretary of state and the attorney general. Thus, the 14th Amendment, adopted in 1868, which declares that "all persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside," became the first law of American citizenship. Much piecemeal legislation followed through the years. Certain Orientals were excluded; liabilities restricting the possibility of gaining citizenship by naturalization were enumerated and refined; Puerto Ricans were made citizens in 1917; nationality quotas were established and adjusted for immigrants; women's citizenship rights were defined and broadened; and in 1924 the American Indians were finally granted full citizenship.

The United States Nationality Act of 1940 repealed all prior acts but retained most of their main features. It provided that naturalization should be limited to white persons, persons of African nativity or descent, and to descendants of races indigenous to the Western Hemisphere. Filipino persons were also made eligible. The act was amended in 1943 to include Chinese persons and persons of Chinese descent. Other present qualifications for naturalization include: age of at least 21; ability to speak English; devotion to American constitutional principles; legal entry into the United States; renunciation of former allegiance; an oath of allegiance to the United States; and evidence of good moral character, including proof that the applicant is neither a polygamist nor an anarchist. Following five years of consecutive residence in the United States and naturalization by a federal or state court of record (those with unlimited jurisdiction), the new citizen stands on completely equal footing with native-born Americans, except for the con-

stitutional provision that he may not become president of the United States. The source of the certificate of naturalization and the list of provisions necessary for naturalization vary considerably from country to country.

In addition to attaining citizenship via birth or naturalization, other modes have been followed. These include: marriage, adoption, long residence (Brazil), land purchase (Mexico), entrance into the public service of a nation (Norway), and political incorporation of a foreign territory. It was by annexation and treaty that the inhabitants of Florida, Louisiana, Texas, California, Alaska, and Hawaii became citizens of the United States.

Great Britain, like the United States, combines the systems of *jus sanguinis* and *jus soli* with regard to children born to their nationals at home or abroad and with regard also to the children of aliens born on their territory. Great Britain extends this right to all ships entitled to its nationality; the United States has not so extended its law. In cases of conflicting citizenship, English law tends to consider territorial nationality as dominant. Great Britain also attempted to bring its citizenship laws up to date by the British Nationality Act of 1948. Members of all self-governing countries within the Commonwealth were entitled to the nationality of their own countries but were granted also the status of British subjects as Commonwealth citizens. This act thereby established a commonality of recognition throughout the Commonwealth. The law also provided a common citizenship, binding citizens of the United Kingdom with those in the colonies. As in the case of the United States, which confirmed equal citizenship rights upon its women in 1934, a British woman does not lose her nationality upon marrying an alien; an alien woman does not become a citizen through marriage to either a British or an American citizen. In both countries, however, it is easier for such a spouse to become naturalized than it is for a typical immigrant.

With the increased migration of peoples throughout the world, the recent great wars which have displaced millions of persons, and the gaps in international law concerning citizenship and nationality, conflicts between the principles of the law of the blood and the law of the soil have brought a greater number and variety of problems for individuals and nations. In addition, other conflicting nationality laws of the various governments, often including racial prohibitions, plus the failure to evolve reciprocal treaties on these matters have brought increased international friction and many more persons with confused or dual citizenship, as well as numerous stateless persons, men and women without any country. The basically opposing views on the citizen and his position in the state held by governments of majority rule and nations of minority rule have served to create many important citizenship problems.

It is easy to visualize cases of conflicting citizenship. German law under the Nazis held strictly to *jus sanguinis*; Argentine law was based solely upon *jus soli*. What was the position of a young man born of German parents under Argentine jurisdiction? States such as Russia and Turkey once held that there was no way a person could give up citizenship in those states. The Italian Fascists revived such theories in attempting to regain control of emigrants to North and

South America. The United States has held that in cases of dual citizenship where, for example, a child born of French parents in the United States has American citizenship according to its laws but is also looked upon as a French national by French statute, he has the right upon reaching the age of majority to declare for one or another of his national ties. Many other nations have failed to accept this doctrine. In recent years double nationality has been reduced by treaty and emerging international law, but the conquests and movements of peoples which marked World War II brought many new cases.

One other form of dual citizenship confronts the citizens in a federal state. They owe allegiance and have special rights and duties in connection with both their state and national governments. A typical example of resulting conflicts is the vexatious problem of multiple taxation. In the United States, following economic and political developments, court decisions, and a Civil War, national citizenship became accepted as supreme. The federal Constitution, courts, and legislation now provide the ultimate civic authority. This is a typical development in many other federated states. Citizens in the United States also face problems of interstate citizenship. Although the Constitution provides that the citizens of each state shall be entitled to the privileges and immunities of citizens in the other states, attempts have been recorded whereby a state has acted to discriminate against citizens of other states in favor of its own. However, high out-of-state fishing and hunting fees and increased tuition charges for non-resident scholars have been upheld by the courts as not being violations of the fundamental rights of the citizen.

The stateless person has no citizenship. Such an individual may have committed a crime providing for the punishment of loss of national rights; in the United States prisoners merely surrender some of their rights temporarily, during the period of their incarceration. Refugees make up the bulk of stateless persons. A refugee from the Soviet Union, East Germany, or some other country may often be ineligible for citizenship in the country of asylum but may at the same time have lost his natal citizenship. Some small countries have been wiped off the map. Some persons have no record of where they were born or of who their parents were. An individual may lose his citizenship through military service for a foreign nation, yet not gain citizenship in that country. Immigrant declarants who have given up their allegiance to their home nations and have not as yet completed the naturalization process in their new countries are also stateless for that period of time. Some individuals lose their native citizenship because they reside abroad too long; meanwhile, having failed to initiate steps to acquire the nationality of their adopted states, they become men without countries. The United States now requires forfeiture of citizenship for naturalized citizens who live for two years in foreign states of which they were once nationals. If such an individual lives in any other foreign nation for five consecutive years, he also forfeits his American citizenship.

Citizenship Education.—All nations use their schools to promote patriotism. They desire to develop young persons who have the necessary knowledge and understanding and who hold the values and ideals which will lead them

to satisfying and competent roles as citizens of the state. Citizenship education has come to mean much more than a grasp of the facts of governmental structure and function. In a broad connotation it may be stated that citizenship education is the central and all-pervading purpose of the schools in a free society. Such schools have a heavy responsibility. They must provide those learning experiences whereby the student comes to comprehend and believe in democracy, and particularly wherein he has the opportunity to build those skills which enable him to function as an intelligent individual and contribute to the general welfare.

In medieval times citizenship education was tied closely to the church and to religious education. This alliance has persisted to the present. The dominant Lutheran element was long reflected in provisions for religious instruction in German schools. In Italy the state has an agreement with the Catholic Church whereby the two are partners in education. Such religious influence in public education has waned in a number of countries. Following the Middle Ages, with the Renaissance, the rise of nationalism, the growth of an economically influential middle class, the spectacular power revolution, the gradual enfranchisement of the masses, and finally the anarchy stemming from the French Revolution, the need became ever more apparent for the state to become actively involved in the educational process. Naturally, the content of education for citizenship varies greatly, depending upon a nation's philosophy and its form of government. The education of Spartan youth was, for example, quite different from the upbringing of the youth of Athens. Modern totalitarian nations, which believe, as did the Spartans, that the individual exists for the state, have instituted educational programs based on the leadership-follower principle. Their schools entail practices which are radically opposed to those followed in nations that are dedicated to majority rule, liberty of the individual, and faith in the reason of the common man.

In the United States there has been great controversy during the past half century concerning the kind of general, basic, or civic education most fitting for the development of socially competent individuals. Many agree that the schools must teach more than the "three R's" and political civics; but there is considerable disagreement about the new content and particularly about the method by which the revised objectives are to be reached. There seems to be, however, emerging consensus as to certain appropriate essentials of American citizenship education. These include the following eight aspects:

(1) It is held that a comprehensive, planned program of civic education, spread across all the years of schooling, should be based upon a thorough knowledge of United States history and government, including an emphasis upon the Constitution and our political institutions.

(2) Dedicated teachers, responsible for the social education of American youth, expected to believe in the American way and to promote loyalty by inculcating these attitudes in their students, are held essential.

(3) Regular reiteration of the fact that every civic right has a corresponding social duty, a practice which develops responsibility on the part of the individual in a democracy, is viewed as a paramount purpose of the nation's schools.

(4) There is an attempt to make civic education functional by relating learning experiences to everyday life in the school and community; book learning is held to be not enough—democracy is made real by giving children the opportunity to participate in planning, and to share in purposeful projects; and by cooperating in practical, civic activities with other community institutions.

(5) It is being realized that the modern world demands citizens who understand peoples and cultures in every part of the earth; youth of the United States need to appreciate better the role of the American system in the international scene, and to gain such knowledge they need to study other governments and varying economic systems, other societies, past and present, with their geographic bases, and the relationship between man and his environment.

(6) There is a growing concern to build programs which will help youth to appreciate the primacy of satisfying human relationships in the affairs of man; courses attempt to point up the import of better group relations, minority rights, social democracy, and of deeper insights into the beliefs of people of other races, creeds, and nationalities.

(7) Current issues are being made an ever more frequent point of departure and source of subject matter; it is held that pupils should be educated to think through problems, to discuss controversial current affairs and arrive at judicious decisions and agreements through a rational approach to the resolution of such issues—youth people who can communicate effectively are more liable to reach consensus of opinion and satisfactory joint action.

(8) Numerous lessons and units are planned to aid the pupils achieve healthy emotional adjustment; students are being aided by the study of personal development, home and family life, boy-girl relationships, and vocational potentialities, as social psychology and mental hygiene are being added to the usual social studies as basic disciplines in civic education.

The developments and conclusions outlined above are the result of intense interest on the part of educators, parents, and community organizations in the welfare of our nation and its youth. Two world wars, the great depression, and an era of quasi-conflict highlighted by a frightening atomic arms race brought these persons together into what developed as a nationwide citizenship movement. The future seemed anything but secure and the schools, as the one common instrument of social education, were envisioned as the prime means of developing youth who share similar values and who would act individually and in concert to maintain what has been great and good in the American past and to assure continued democratic progress.

Experiments in citizenship education marked the decade following World War II. Conducted under varying conditions, these studies attempted to explore different approaches and to help chart the means toward increasingly effective combinations for civic education. A five-year study in Detroit enabled teachers and pupils to organize total-school programs of citizenship education. Kansas, Nebraska, and Illinois are examples of states which initiated statewide civic education curricular studies. Syracuse University sponsored an annual survey of the characteristics of leading "good citizens" in the high schools of New York. Investigations in classroom organization and procedure for citizenship education were conducted by such institutions of higher learning as Stanford and Miami universities. State departments of education fostered numerous projects in the area. Yearbooks of influential national societies (National Council for the Social Studies, *Education for Democratic Citizenship*, 1951; American Association of School Administrators, *Education for American Citizenship*, 1954) reflected reports appearing in professional journals and popular magazines. Pamphlets, teaching aids, and units were sponsored by a host of such diverse groups as the National Association of Manufacturers, the American Legion, the Civic Education Project of Cambridge, and the National Education Association. In 1954 the Citizenship Education Project, sponsored by Columbia University Teachers College and the Carnegie Fund, had involved about 1,500 secondary schools throughout the United States

in developing citizenship education practices in school and community.

All this activity resulted in the exchange of many fruitful ideas for furthering citizenship education in America. Much of the work had not in 1954 as yet crystallized, and current publications and conference topics revealed that enthusiasm had not abated. Many results seem to substantiate what educational reformers have been claiming for years: traditional subject matter presented by traditional method alone holds little promise of enabling students to better attain the aims of American citizenship education. The Detroit Citizenship Study pointed out to those interested in necessary further research that the attitudes and understandings of democratic citizenship are acquired as the result of a many-sided process. The director cautioned, that until more knowledge is gained, the schools should maintain a balanced relationship among the techniques of teaching democracy. The Detroit study did find a genesis for such knowledge and values in four approaches; the attributes of democratic citizenship were found to be learned via emotional appeals, by the intellectual process, through participation in democratic activities, and as the products of emotionally balanced individuals. The importance of a broad program of citizenship education, featuring cooperation between home, school, and other institutions, and which allows for significant pupil action, was also evidenced by a number of the studies. The application of such findings gave promise in 1954 of continually improved education for democratic citizenship in the United States. See ALIEN; ALLEGIANCE; NATIONALITY; NATURALIZATION; NATURALIZATION LAWS; UNITED STATES—*Legislative and Executive Control* (Voting Qualifications).

Specialist in Social Studies Education, Florida State University.

CITLALTEPETL, peak, Mexico. See ORIZABA.

CITRIC ACID, a naturally occurring crystalline acid, found in most common fruits, particularly lemons, has the formula, $C_6H_8(OH)(CO_2H)_2$. It has a specific gravity of 1.542, a melting point of $153^\circ C.$, and decomposes at $175^\circ C.$ For many years this acid was made by neutralizing concentrated lemon juice with lime, the free acid being liberated from calcium citrate by sulphuric acid. A fermentation process in which molasses is employed along with various molds yields the acid at about one fourth the price of the lemon-juice method. Citric acid is used in preserving fish, coloring vegetables, and in manufacturing carbonated beverages, jams, and pastries. It is important in the manufacture of mirrors, in engraving, dyeing and calico printing. Its salts enter into the blue-print and certain phases of pharmaceutical industries.

CITRON, a tree (*Citrus medica*) related to the lemon, with a large lemonlike fruit having a thick peel and a small amount of very acid pulp. It is grown chiefly in the Mediterranean regions and large amounts of the fruit are preserved in brine and shipped to the United States, where the peel is candied and used for confectionery and culinary purposes. The trees are grown to a small extent in southern Cali-

fornia. The name citron is also applied to a small variety of the watermelon which is used for preserving.

CITRON MELON. See **MELONS**.

CITRONELLA OIL, an aromatic oil obtained from a kind of grass (*Cymbopogon nardus*), cultivated at Singapore and in Ceylon. It is used for scenting soaps and perfumes, and is applied externally to ward off mosquitoes. Other species of the same genus and some other allied genera also yield essential oils.

CITRONELLE, town, Alabama, in Mobile County, altitude 330 feet, on the Mobile and Ohio Railroad, 33 miles northwest of Mobile. Here on May 4, 1865, the last Confederate Army east of the Mississippi surrendered. Pop. (1940) 1,057; (1950) 1,350.

CITRUS FRUITS as pertaining to common commercial species of the genus *citrus* (family Rutaceae) are trees with dense evergreen foliage which vary in height from fifteen to forty feet at maturity. Leaves are usually a dark, glossy green, although the depth of color varies among the species and with soil fertility. The flowers produced in great profusion give off an exotic fragrance which permeates the countryside during the main blooming period. Flowers are mostly white, although some show tints of red. They are small, rarely with more than one or one and one-half inch spread. Blooms may occur more than once a year, resulting in fruit of varying degrees of maturity on the tree at any one time. The regular bloom from some species commonly occurs when a mature crop is still on the tree. The fruits vary in shape from round to oblong, oblate, elliptical, and in size of from one to eight inches in diameter and length. Yellow and orange are the predominant fruit colors, although variations from light lemon yellow to reddish brown are common. The well-known commercial species are oranges, grapefruit, tangerines, lemons, and limes.

These fruits, which have been cultivated for thousands of years, are native to the tropical and subtropical areas of southeastern Asia. From there they were spread to Asia Minor and the Mediterranean region of Europe. Such fruits as lemons and sweet oranges were first reported in European literature about 1400 A.D. Columbus on his second voyage (1493-1496) is believed to have planted the first citrus seed in the Western Hemisphere. This was on the island of Haiti. From there, and from seeds brought from Europe by later explorers, citrus was spread throughout much of the Caribbean region and into Florida by 1565. Introduction into Arizona is believed to have occurred around 1707 and in California in 1769.

Climatic requirements for citrus fruits limit production areas to within thirty-five degrees of the equator, although this may vary by several degrees depending upon bodies of warm water, ocean currents, and elevation. While limited to tropical and subtropical areas, citrus fruit trees do best in subtropical areas and even near the latitudinal limits thereof. Since much of the world's desert area is within this zone the available area for optimum citrus fruit culture is limited. Perhaps this is well for, even with a relatively limited physical area, production occa-

sionally exceeds available commercial outlets.

Within any area of general adaptation the location of a citrus grove is determined primarily by the minimum temperatures which may prevail. This assumes that soil and other physical properties of the location are suitable. Temperatures may vary widely within small distances because of air drainage, elevation, and proximity to bodies of water. In general, a location which is frequented with temperatures as low as 28°F. for a period of several hours duration places too great a hazard for commercial production of the hardy orange and grapefruit species, and especially so for lemons and limes. At such temperatures trees as well as fruit are damaged. The extent of tree damage will vary by species, by age of tree, amount of succulent growth, and the general nutritional level of the tree. Ironically, it is near this margin of success or failure because of cold that the finest quality citrus fruit is generally produced. Heating groves during short or relatively severe periods of cold is common in some of the most productive citrus fruit areas.

Within the limitation set by climate and other physical factors and further conditioned by economic and other human influences, well defined areas of commercial citrus production have developed. The most important are in the United States, around the Mediterranean, the subtropical area of eastern South America, Japan, southeastern Asia, South Africa, and Australia. The United States is by far the leading producing country accounting for 56 per cent of an estimated world production of 343,950,000 boxes in 1946. The average weight of boxes varies; that of oranges being 70 pounds, grapefruit 80 pounds and lemons 76 pounds. Brazil was next in importance in 1946 followed closely by Spain and Italy.

CITRUS FRUITS

Production, Utilization, Prices Per Box *

* Season average returns per box to growers, at the packing house door.

The proportion of the production of the various citrus fruits varies among countries. For example, in 1946 the United States produced 47 per cent of the world's oranges, 62 per cent of the lemons, and 94 per cent of the world's grapefruit; whereas Brazil, the second largest citrus-producing country, limited its production to oranges, which equaled 11 per cent of the world's orange output. In 1946 Italy contributed 27 per cent of the world's lemon and 5 per cent of the world's orange production. Near-by Spain produced 7 per cent of the world's orange crop and only 6 per cent of the lemons.

Though the history of the spread of citrus fruits reads as a romance, the story of the re-

cent expansion in production of this delectable fruit and its products is nothing short of spectacular. From 1920 until 1946 the world production of citrus almost tripled. Much of this increase occurred in the United States where the production of oranges in the same period increased from 25 to 110 million and grapefruit from 6 to 60 million boxes. No other crop in the United States of comparable commercial importance, save soybeans, expanded so rapidly during the period indicated.

Such an expansion in production had to be accompanied by corresponding increases in consumption, which in the United States increased from 18 pounds per capita in 1910 to 92 pounds in 1947. The factors mainly responsible for this increase include improved and more rapid transportation and distribution facilities, emphasis on the nutritional value of citrus fruits, aggressive advertising and merchandising, and the development of the citrus canning and processing industry which permits of wider distribution both as to time and area.

The production of citrus fruit in the United States, which reached 192,000,000 boxes in 1947, is concentrated in the states of Arizona, California, Florida, Louisiana, and the southernmost part of Texas. Small quantities are grown locally in coastal areas of Alabama, Mississippi, and Georgia. More than 90 per cent of the United States orange crop is produced in California and Florida. Florida and Texas account for more than 85 per cent of the grapefruit production. Practically all of the commercial lemons are produced in California; whereas Florida produces the bulk of the lime crop with small quantities produced in Texas and California.

Citrus fruits are one of the best sources of vitamin C and, in addition, contain vitamin A, thiamine, riboflavin, and niacin. At maturity they are usually well colored, full of juice, and the acid and sugar content together with other constituents of the juice is such as to give a delicious flavor. Unlike many other fruits, citrus, on attaining maturity, can remain on the tree for weeks and with some species for months without becoming over-ripe or over-mature. Again, unlike certain other fruits there is no further ripening process after harvesting, other than for changes in skin color. At certain times of the season, and varying with weather conditions, citrus fruit may attain full maturity without the desired degree of skin color. To overcome this condition, oranges, grapefruit, and tangerines are placed in coloring rooms immediately after harvesting. There, under controlled temperature and humidity, ethylene gas is released for a given period of time. This process hastens the natural coloring of the fruit. Lemons, unlike other citrus fruits are picked at varying stages of coloration, varying from dark green to yellow. Those with green stages of coloration are "cured" before shipment, in rooms with controlled humidity and temperature (50° to 60°F.). Under such conditions they are held from several weeks to six months.

The harvesting, packing, and processing of citrus fruits is highly organized and mechanized. Packing and canning plants provide crews and equipment for picking and hauling to the plant. On arrival at the fresh fruit packing house, fruit is treated to bring out the color if needed. It is then washed, treated to retard decay,

waxed to reduce shrinkage and improve appearance, sized, graded, sometimes wrapped, and packed in boxes or bags. Each of these operations is mechanized, except for grading and place packing in boxes. After packing, the fruit is often precooled, depending on the season of the year, and loaded and shipped mainly in refrigerated cars, either to keep temperatures down or to protect against freezing. For near-by and even more distant markets significant quantities are shipped in ventilated cars and trucks.

Since techniques were developed and improved in the 1920's and 1930's for canning citrus juices and sections, a rapid expansion has occurred in the amount of fruit processed. In the 1946-1947 season 28 per cent of the United States orange and 45 per cent of the grapefruit crop was processed. Oranges are processed into single-strength juice and concentrated juice, while the principal processing of grapefruit is confined to single-strength juice and canned sections. Important quantities of blended orange and grapefruit juice are canned.

The canning of citrus fruit juices is even more highly mechanized than in handling fresh fruit for market. Fruit is accumulated in large bins from whence it is moved to the canning plant. It is thoroughly washed en route to insure clean and bacteria free fruit at the time of juicing. Juice extraction is entirely mechanized. The juice is accumulated in large tanks for proper blending to insure optimum quality. It then is flash pasteurized, canned under vacuum, labeled, and the cans are placed in cardboard shipping cases. In the manufacture of citrus juice concentrate, water is removed from the juice by "boiling" under vacuum. Temperatures which need not exceed 55°F. are kept to a minimum to protect natural fruit flavors. After concentration to the desired level, canning proceeds in the same fashion as for single-strength juice. Since World War II an increasing proportion of orange juice concentrate with three parts of the water removed is being frozen. This product, when reconstituted by adding the amount of water removed in processing approaches, if not equals, freshly squeezed orange juice. By-products from citrus fruit processing include pectin, citric acid, orange and lemon peel oils, seed oil, citrus molasses and stock feed.

Citrus fruit producers in the United States market their fruit in various ways. Growers may sell their fruit for cash on the tree for harvesting and marketing by the purchaser. Many are members of cooperative marketing organizations which perform all marketing services. Still others have their fruit harvested and marketed for their account, while a few harvest and provide their own packing and marketing facilities. Citrus fruits for fresh consumption reach the consumer through several channels. Sales to wholesalers and distributors may be made at the shipping point, or on delivery at the terminal markets, through terminal auction markets, or by consignment to commission merchants. Retailers may obtain their supplies directly at auctions, but more generally deal with wholesalers and jobbers. Large-scale chain store organizations often buy directly at the country shipping point. Canned citrus juice is distributed through brokers and wholesale grocers, although large retail organizations, as in the case of fresh fruit, commonly buy direct from processors.

In addition to the domestic market for citrus fruit, United States producers, along with producers in other parts of the world, look to export markets to dispose of a portion of their output. Export outlets are of relatively greater importance to producers in Spain, Palestine, Italy, and South Africa than for United States producers. The principal foreign market for United States citrus fruit is Canada. Because of its proximity and the availability of through rail transportation, the Canadian market is almost considered in the same category as the domestic market. Other important foreign markets for United States citrus fruit, prior to World War II, were the United Kingdom, France, and other northern European countries.

The commercial importance which the citrus industry attained by 1948 basically rests upon the palatability and health qualities of citrus fruit and their products which have made them so universally acceptable to all consumers. Knowledge that adequate quantities of vitamin C in the daily diet is essential to good health, together with the widespread knowledge that citrus fruit is one of the richest sources of this vitamin, and that it contains other important vitamins and minerals as well, has been a powerful force in directing consumers to the regular use of citrus. This factor, combined with reasonable prices and the universal taste appeal of citrus fruit, has progressively provided additional outlets for this crop.

CITTA VECCHIA, chêt-tā' vĕk'kyā, or **CITTA NOTABILE**, a fortified city of Malta, formerly the capital, near the center and almost on the highest point of the island, seven miles west of Valletta, which became the capital in 1570. The city was severely bombed by Italian and German aircraft during World War II. Pop. (1931) 22,182.

CITTADELLA, chêt-tā'dĕll'ā, Italy, city in Province of Padua, compartimento of Venetia, 30 miles northwest of Venice. It contains beautiful churches and botanical gardens. Its modern industries are the manufacture of paper, cotton, woolen goods and linen. It was founded in 1220, as a protection against Treviso, and has still retained its walls, tower and moat. Pop. (1936) town 4,588; commune 12,966.

CITY. The term "city" has various meanings. To the student of Greek and Roman history it means not only the walled town of Athens or Rome but the territory surrounding it, in the latter case very widespread, the inhabitants of which enjoyed the privileges of citizenship; in other words, a city-state. In England, the term still is used sometimes to designate a borough which is also the capital of a bishop's see, a carry-over from a now archaic ecclesiastical terminology. In the United States, a city is, in legal language, a particular type or class of municipal corporation. As commonly used, however, city merely means a relatively dense aggregation of population of considerable size, in which the conditions of life can be described as urban in contrast with the rural life of the open country.

It is in this broad popular sense, that the word city is used in this article. In that sense cities are a universal phenomenon of civilized society. They are found in every country which has advanced beyond a pastoral economy, a large number, indeed, in countries like India and China which have been only slightly touched by modern industrial progress.

It is impossible to draw an accurate line as to where country leaves off and city begins. No specific population or degree of density can be set down as necessary to constitute a city. The United States census bureau for statistical purposes classes all municipalities with over 2,500 population as urban. Many places of 2,500, however, are obviously rural. Since some kind of mathematical definition seems desirable for purposes of clarity, the reader may assume that when this article speaks of cities it means compactly built-up communities of at least 5,000 people.

Cities had their beginnings in the need of naturally gregarious mankind to seek safety and mutual protection in some easily defensible location. The inaccessible rock of the Acropolis determined the site of Athens. Rome owed its start to its seven hills surrounded by the marshes of the Tiber. The defense motive alone, however, would never have produced cities of any size. It was the development of trades and crafts behind the protection of the city walls, and the exchange of their products for food and raw materials, on which city growth was fed. Naturally, the earliest large cities were found in the Nile and Tigris-Euphrates valleys where easily navigable streams enabled this exchange of goods to take place over a wide and fertile area. Thus, thousands of years ago, the main forces which have produced cities in later times, that is, industry, commerce, transportation and markets, were manifest in Babylon, Nineveh, Memphis and Thebes.

In primitive times, accessibility to water transportation was of the first importance to city growth. It was not by accident that the famous cities of classical antiquity were to be found mostly dotting the shores of the Mediterranean. In modern times, railways, highways and airways have usurped to considerable degree the place of water transportation in determining the sites and size of cities. Several of the world's greatest cities—Moscow, Berlin, and Paris, for example—are now located far from the sea, with only minor streams and canals to serve them. There can be no doubt, however, that the great ports of London and New York have played a major part in putting them at the top of the roll of cities. The places where land and water or ocean and river transportation meet are places where merchants thrive. Commerce, the exchange of goods, is an important supplement to industry, the production of goods, in building up the wealth and population of cities. Of the twelve largest cities in the United States, six—New York, Philadelphia, Los Angeles, Baltimore, Boston, and San Francisco—are ocean ports. Three more—Chicago, Detroit, and Cleveland—are important Great Lakes ports, while St. Louis, Pittsburgh, and Washington are located on navigable rivers. This circumstance has had little to do with the growth of Washington but it had much to do with the early prosperity of St. Louis and Pittsburgh and is still a factor in their commercial life.

There are other causes which contribute to the growth of cities. Some have gained importance as centers of religious devotion—Rome and Jerusalem being striking examples. Others have profited from their reputations as centers of learning or art. Paris for centuries has drawn students from all parts of the world to its ateliers and universities, and tourists by the thousands to its galleries and museums. Climate has been a powerful lure in drawing population to such famous centers as Nice, Miami, and Los Angeles. By far the most important of these noneconomic factors is government. Imperial Rome produced almost nothing but government which it exchanged for tribute from its far-flung provinces. In recent times, the growing tendency to centralize the rapidly increasing activities of government in national capitals has had much to do with the swollen proportions of London, Berlin, Paris, Washington, and Moscow. Into these vortices of power and administration are drawn not merely the agents of government but those who seek its services and favors. Particularly striking has been the growth of Washington which in 1900 had only 278,718 inhabitants and rose to 663,091 in 1940. Since that time its growth has gone on more rapidly than ever, its reflection in the census tables depending on how much of this increase has spilled over into adjacent Maryland and Virginia.

Though the life and achievements of cities stand out preeminently in the earliest pages of recorded history, it has only been in the 20th century that they have assumed the character and proportions with which we are now familiar. The cities of the ancient world were mostly small, densely populated areas surrounded by defensive walls. Politically these centers were completely identified with the surrounding country which formed an integral part of the city-state. The truly urban area within the walls, judged by modern standards, was very limited in extent and population. These ancient cities looked large to contemporary writers and they brought down to our day an exaggerated impression of city size. Exact figures as to the population of ancient cities are not available but the estimates of scholars put the population of Athens at the height of her glory at from 40,000 to 140,000, Jerusalem at 30,000, and Carthage—one of the largest of the Phoenician cities—at not more than 300,000. Rome in the Augustan era, generally agreed to have been the largest city of that time, is best estimated at not more than 800,000, and many modern scholars put its population at a smaller figure. Indeed, providing for 800,000 people in a city without any artificial means of passenger transportation except the chariots and litters of the rich was not the least of the marvels of the capital of the world.

Following the barbarian invasions of the 4th century cities practically disappeared from western Europe. They did not all go at once. Some were destroyed by the invading hordes who had no use for cities except to pillage them. They would probably have sprung to life as have the cities battered in World War II had it not been that trade routes were broken and that the simple agricultural economy and rigidly formal social organization of feudalism left cities to wither on the vine. A few Mediterranean ports continued some shadow of urban

life on the basis of trade with the East. Rome was a long time reaching its low point of 17,000 population about the end of the "Babylonish Captivity" in 1377, but most cities died more promptly. Constantinople, at the extreme eastern limit of Europe, was the only European city to go through the Dark Ages with a population of 100,000.

The rebirth of cities began with the revival of trade in the 10th century. Slowly at first, and then with increasing rapidity, the famous cities of medieval Europe rose. The city republics of Italy, the Hanse cities of Germany, the flourishing cities of the Low Countries, in the course of a few centuries played once more a major role in history. They threw off the shackles of feudalism and gave birth to modern systems of law and justice. They contended in the field with armies of kings and princes. They developed a life so rich and pleasant as to cause some writers to look back to the 12th and 13th as the best of centuries. They were, however, of no great size compared with the modern metropolis. At the beginning of the 16th century there were but six European cities with more than 100,000 population—Constantinople, Paris, Naples, Venice, Milan, and Lisbon. Ghent at that time boasted 50,000 people, London, and Bruges 40,000, and Brussels, Louvain and Liege 20,000 to 30,000 each.

With the discovery of America a new era in the growth of cities began. World trade replaced local trade. Cities which could exchange their manufactured goods for the food and raw materials of distant continents had almost no limits to their growth. The die was cast for this revolution when the ships of the early navigators began nosing their way into the bays and rivers of the New World. As time has gone on the ships have become larger and faster. Steam has replaced sail, and the turbine the reciprocating engine. The impetus given city growth by Columbus' successful voyage never relaxed its force until the New World became an old world with a mature economy of its own and no more physical frontiers to conquer. In other words, from 1492 to 1914 world trade exercised a continuing and constantly accelerating influence on city growth. Repeated world wars and nationalistic policies of trade restriction have hampered and obstructed for a generation the free exchange of goods on a world-wide basis but without causing any shrinkage in the size of cities.

Other influences, of course, have combined with worldwide trade to cause the extraordinary growth of modern cities, some of which are as powerfully operative as ever. One is a marvelous development beginning early in the 19th century of the means of land transportation. This has made cities like New York and London a physical possibility by enabling the worker to live far from his work, his amusements and his shopping center, as well as providing a network of agencies for the movement of goods to and from cities. Land transportation has now been supplemented by air transportation but what effect it will have on city growth is as yet problematical. A second force has been the vastly increased productivity of labor in industry. Beginning with the industrial revolution, machines driven at first by water, then by steam, and finally by electricity, have replaced old-time hand labor. Machine production means, in fact,

city production, as large-scale industry when not originally located in a city quickly builds up a city around it. The third force has been one of equal importance but one frequently ignored in popular discussions of the subject of city growth—the agricultural revolution. This has been no less significant than the industrial revolution. This will be clearly realized when it is remembered that the modern plow did not come into general use until well into the 19th century; that, up to that time, corn was planted by hand and covered with a hoe; that such cultivation as a growing crop received was by the application of muscle to a hoe handle; that hay and grain were cut with a scythe and raked by hand while grain was threshed on the barn floor with a flail as in Biblical days. Modern agricultural machinery, not to mention improved breeding of animals and more productive trees and plants, enable a much smaller proportion of the world's population to supply the food for city people than 150 years ago. All of these forces are still operating, and, while the rate of city growth has slackened in recent years, cities are still growing and the proportion of city dwellers to country folk is steadily increasing.

Cities of 100,000 population are now scattered broadcast over the world, 92 in the United States, 224 in Europe, and 248 in the rest of the world. Of these 564 cities, 33—5 in the United States, 15 in Europe and 13 in the rest of the world—had more than a million inhabitants prior to World War II. City life indeed has become the characteristic form of existence for a majority of the people of the United States and western Europe. In 1931 the percentage of the population living in places of 5,000 or more was 77.3 in England, 69.5 in Scotland, 56.4 in Germany, 45.5 in France, 78.8 in Holland, 60.4 in Belgium, 69.7 in Italy and 52.2 in the United States. In the United States the percentage rose only slightly, to 52.7 in 1940, reflecting a movement away from the cities during the depression years. The intense industrial activity during World War II and after apparently has reestablished the trend from country to city. Authentic figures as to the proportion of urban to rural population are not available for most other countries, but from the number of great cities which are to be found everywhere outside the equatorial jungles and polar icecaps it is clear that the dominant position of the city is a worldwide phenomenon. We sometimes call this the age of steel, the age of electricity or the age of the automobile. It certainly can be called, as no other period could, the age of the city.

The history of these cities, whose growth from primitive antiquity to the present day this article has traced hurriedly has been the history of civilization itself. In the beginning they furnished the first opportunity for extensive division of labor and opened the door to invention and industrial progress. They suffered an eclipse in the Dark Ages, but the few which contrived to exist kept alive the traditions of ancient skills, and in the 10th century civilization once more started its upward spiral from the little cities which sprang up at the foot of a castle just outside the precincts of an abbey or at the head of navigation of some stream. From that day to this leadership in industry, commerce, art, and literature has been found in the

cities. Many individual leaders, it is true, have been country-born and bred, but almost without exception it has been the city which has supplied the inspiration and opportunity for their genius.

These are facts which it is well to remember, when pessimists decry the city's influence on its people and deny its capacity for self-government. This negative attitude of mind has been reflected in the United States in the general gerrymandering of legislative districts to permit the farms and small towns to dominate the cities. There is no denying that cities from the earliest times often have been turbulent, revolutionary, and corruptly governed. American city government was labeled in 1888 by James Bryce in his *American Commonwealth* as the "one conspicuous failure of the United States." That label has stuck though it no longer represents the truth about American cities. American city government was at a low ebb in 1888 but it has since been transformed not by the efforts of rural reformers but by the people of the cities themselves into what may properly be called the one conspicuous political success of 20th century United States.

Cities early developed democratic means of meeting the problems which faced them. They have sometimes succumbed to tyrants and bosses from within, or to the centralizing tendencies of kings and dictators from without. The career of the cities has been a chequered one as has been the history of every human institution. Yet there are no more glorious pages in the story of the struggle for popular self-government than those which were written by the Italian city republics of the early Middle Ages, the Flemish cities of the 12th century, the Boston town meeting in its controversy with the British crown, or the people of Cincinnati when they threw out a boss and wrote themselves a new and admirable form of government in 1924.

Cities have repeatedly demonstrated their capacity, when released from the leading strings of centralized government, to handle their own affairs. There is no reliable evidence to show that man cannot successfully adjust himself to the conditions of city life without either physical or moral deterioration. Even the bad effects of city slums can be overcome by health, recreational, and educational programs now under way in most cities. Cities, historically speaking, have had a sort of compactness and unity which has enabled them to grapple vigorously with crises. Means of communication by press, radio, and the mouth-to-ear contacts by which news travels faster even than over wires or through the atmosphere have always been and still are more effective in the city than in the country. The greatest internal handicap under which American cities have suffered has been the great diversity in race and language in their populations. Integrated public opinion is difficult to secure among racial and language groups whose backgrounds differ widely and to whom demagogic appeals of a racial character are most effective. This condition, however, is gradually correcting itself under present immigration laws.

In the meantime, however, a new difficulty confronts the great urban communities in dealing with their complex problems. This arises from the tendency of urban population to overrun legal city boundaries. Where the political city and the economic and social city no longer coincide, it is difficult to secure coherent and effective

action. This condition exists in all great centers of population and has nowhere been more than partially solved by annexation or consolidation. In fact, the outlying units of government over which the population of a modern metropolis sprawls generally are adamant in their resistance to absorption by the central city. How serious this problem has become is apparent from the fact that New York's metropolitan area extends into three states, Chicago's into two states, and Detroit's into two countries. That it is growing more and more intense appears from the United States census returns for 1930 and 1940 which show the nucleus cities of Philadelphia, Boston, Pittsburgh, San Francisco, St. Louis, and Cleveland actually declining in population while the portion of their metropolitan areas lying outside the nucleus city increased substantially. The causes of this outward movement of population are the obsolescence of homes in the close-in section of the nucleus cities and the gradual deterioration of old residential neighborhoods, plus the facility afforded by the automobile of living miles away from one's work. The results are the spread of blight and slums in the nucleus cities, and a serious threat to their financial soundness. Worst of all, however, is the inability of a metropolitan region, made up of dozens or even hundreds of independent local governments, to devise means of meeting its common problems.

THOMAS HARRISON REED.

CITY APPROPRIATIONS. See APPROPRIATIONS, AMERICAN SYSTEM OF; BUDGETS, AMERICAN.

CITY BUDGETS. See BUDGETS, AMERICAN; APPROPRIATIONS, AMERICAN SYSTEM OF.

CITY COUNCILS, American. In all American cities there is a city council which can properly be called the governing or policy-determining body of the city. It adopts ordinances not only regulating the conduct of the public, the use of the streets and such matters, in the interest of the public peace, health, and safety, but creating positions, fixing salaries, making appropriations, and authorizing or proposing bond issues. In it are ordinarily vested all the powers and duties of the city government which are not specifically given by the city charter or the laws of the state to some other officer or agency of the city.

The organization of the council, its legal powers, and its relative weight in the city government, however, differ widely as between the types of city government found in the United States. These are: (1) the independent executive type which is again divided into two subtypes, the strong-mayor and weak-mayor plans; (2) the commission plan; and (3) the manager plan. (See MUNICIPAL GOVERNMENT, AMERICAN.)

City Council Under Strong-mayor Plan.—The council is at its weakest in the strong-mayor cities which are few in number but which include cities like New York, Boston, Detroit, St. Louis, and Indianapolis. The council in such cities is reduced to purely legislative functions. It still makes regulatory ordinances and grants franchises. Its consent is necessary to confirm bond issues and to make appropriations. In the field of regulatory ordinances,

however, the only one in which it preserves much initiative, it is subject to the mayor's veto. In the matter of appropriations it can act only on the recommendation of the mayor. It cannot add anything to his budget or other financial proposals. It can only reduce or reject them. This means that the mayor holds the whip hand in matters of finance. Since most municipal activities involve the spending of money the strong mayor is the chief force in determining policy as well as in directing administration. Moreover, the council in these cities does not have that share in the administration which comes from the power to confirm the mayor's appointments. Of course, the council is in a position to hamper the mayor and his executive subordinates by cutting down or rejecting appropriations, and to embarrass them by publicizing what its members conceive to be the delinquencies of the city administration. These, however, are at best negative powers, and, in fact, are so feeble as to lead to the jesting remark that in strong-mayor cities there is not much to do with the council but to put it out of pain.

New York, the largest of the strong-mayor cities, has in effect a two-chamber city council since the mayor's budget goes first to the board of estimate and apportionment and much other important city legislation requires the approval of that body as well as of the council. The board of estimate and apportionment is made up, with one exception, of administrative officials—the mayor, comptroller, president of the board of alderman, and the five borough presidents. Its presence tends to still further submerge the council. The New York Council was for some years elected by proportional representation but as the result of a referendum in the fall of 1947, New York hereafter will elect its councilmen by districts.

In other strong-mayor cities the organization of the council, methods of election, terms and salaries of councilmen are much the same as in weak-mayor cities.

Council Under Weak-mayor Plan.—Cities under this plan, which prevails in about 1,200 cities of over 5,000 population, have councils of varying degrees of authority. In many such cities the council is free from any mayoral veto of its decisions. Mayors in some cities gain some influence by being ex officio the presiding officer of the council, but in most of them the council chooses its own president. In all such cities the council either makes up the budget through one of its committees, or the mayor prepares it subject to the power of the council to amend it up or down at will. The council, usually, also has the power of confirming most if not all of the mayor's appointments. Not only does the council have this share in naming the heads of departments and other important officials, some of whom it frequently elects without the mayor's intervention, but its control of the purse makes effective its control of these officials after they are elected. It is usual to have a council committee for each important unit of the city administration, and these committees often hold a tight rein on the department they supervise. It is obvious that under this system, each committee, to a large extent, will be a law unto itself, producing a decentralized and disorganized kind of city administration.

This does not mean that a mayor with a strong political following and a flare for leadership does not sometimes lead a council by the force of his personality. The public frequently looks up to the mayor as its peculiar representative in the city government and his opportunities for publicity are much better than those of councilmen. Some mayors use these opportunities. Generally, however, the council is supreme in a weak-mayor city.

The composition of the council varies from city to city but one description will serve for all cities of the independent executive type whether they are provided with strong- or weak-mayor charters. In addition to New York 13 cities, all in New England, still cling to the two-chamber council. Such councils, in imitation of the state and federal governments, were common in the first half of the 19th century. They have gradually disappeared and are to be regarded as an anachronism even in New England. The largest single-chamber city council is that of Chicago with 60 members. The number runs down to 2 or 3 in some small municipalities. The median for cities of over 500,000—and all such cities have the independent executive type of government in one form or the other—is 19. For all cities of over 5,000 it is only 7. This is in marked contrast to the size of English, French, or other European city councils which are usually large bodies. The principle seems to have been generally accepted in this country that a city council should be a body small enough so that its members can sit around a table and discuss city affairs without making speeches at one another or at the attending citizens. The spread of at large elections has also had a decided effect in keeping down council membership. Cities as large as Detroit and Pittsburgh, which elect their councils at large, have found nine to be a convenient number.

Councilmen in slightly over half of this group of cities are elected for two-year terms and in about 40 per cent of them for four-year terms. Election by wards and election at large are about equally prevalent (37 and 40 per cent respectively). The remainder use a combination of the two methods—usually a majority of the council being chosen by wards.

Candidates for the council are elected under party designations in a majority of cities with the independent executive type of government. A large minority—over 40 per cent of this class of cities—use a nonpartisan ballot. This does not mean necessarily that there is no party activity in city elections. Generally speaking, partisan ballots and intense party activity are the prevailing practice in the northeastern section of the country, while actual nonpartisanship becomes more common the further one goes toward the Pacific coast.

Salaries are paid councilmen in all cities of this class with over 250,000 people. The salaries range from \$1,800 to \$8,000 in those of over 500,000, and from \$600 to \$4,800 in cities of from 250,000 to 500,000. Below this population level there is no salary of more than \$3,500, and the median falls from around \$500 for cities of from 50,000 to 250,000 to \$100 for those of from 5,000 to 10,000. Numerous small cities pay councilmen nothing.

The work of a councilman in a large city is often rather heavy. If he is elected from a ward

he is expected to run errands at city hall for his constituents. He serves on one or more council committees and these committees, of which there usually is one for each important branch of the administration in a weak-mayor city, are in such cities the real directors of administration. There are also many matters, such as street openings, street widenings, and the making of public improvements by special assessment, which require repeated acts by the council or council committees. In a period of public works activity many hours a week may be spent in this way. It is natural that a councilman should expect some compensation for such service. This feeling is sometimes the excuse that is offered for the abuse of the councilman's opportunities for private gain. In small cities the post of councilman is not a laborious one.

Council Under Commission Government.—

The commission form of government, which exists in some 300 cities of over 5,000 population, including such places as Newark, Jersey City, New Orleans, and St. Paul, is council government pure and simple. All the powers of the city are vested in a council, usually of five members, though three are found in some small cities. Its individual members are each the head of one of the departments into which the city administration is divided. In theory, at least, the council is the final authority in administrative, as well as in legislative matters, appointments to all the principal positions being made by it, usually on the recommendation of the commissioner in charge of the department concerned. When budget time approaches each commissioner prepares the estimates of expenditure for his own department. The commissioner in charge of finance puts these and the estimates of revenue together and then the council meets to discuss and adopt the budget. No one member has any more authority in the body than any other. The mayor, who sometimes is elected to that position by the people and sometimes chosen by his colleagues, has no veto. He merely presides over the council and acts as the ceremonial head of the city. He has no more power than the other members of the council, except what he may derive from a certain prestige which attaches to the title of mayor.

Under the commission plan there are no committees unless you choose to regard each commissioner as a committee of one for his department. Obviously, the combination of the duties of working head of a department and those of councilman, including the tedious routine of street openings and assessments, spells work. The commissioners, except in a very few places, receive salaries. The highest paid is \$7,500, while the median in cities of 250,000 to 500,000 is \$6,000, and in cities of 50,000 to 100,000 is still \$3,550. Where substantial salaries are paid, the cost of legislative and executive overhead under the commission plan is greater than for cities of similar size under the independent executive or manager types of government.

Councilmen under the commission plan invariably are elected at large. The term is four years in over 60 per cent of the cases and two years in about 25 per cent. Three quarters of the cities of this class use a nonpartisan ballot.

In some commission-governed cities, the com-

missioners run for specific commissionships. In others, they run for the council either on a general ticket or against designated opponents. Where the assignment of the departments to commissioners is not determined in advance by election they are assigned by vote of the commission. This frequently results in conflict within the commission, and if there are majority and minority elements within it, to an unfair division of patronage and authority.

As a legislative body the commission council operates, except for the absence of committees, in much the same way as do councils under the independent executive type of government. The commission council has a clear advantage in transacting business because of its small size and the intimate knowledge each of its members has of at least some of the details of the city's business. When it comes to the performance of its administrative functions, the commission plan runs into difficulty. The commission as a whole is supposed to be the general executive and to supervise the conduct of its members as heads of departments. In theory, this should produce a body of extraordinary efficiency and there have been instances, as in the early days in Galveston, when such was the case. Success in this direction, however, requires commissioners of a very high type working in such perfect harmony as to be ready to accept suggestions and criticism one from the other. This combination is rarely achieved. (The natural tendency of commissioners is to avoid criticism of one another on the principle of doing unto others as you would have them do unto you, an excellent ethical principle that has obvious limits when applied by members of a body supposed to represent the public interest.) Commission councils tend in most instances to become merely routine bodies which leave everything of an administrative nature to be settled by the individual commissioners as department heads. This leads to a high degree of decentralization in administration in which each department is a little empire by itself. When, however, commissioners disagree, there is apt to ensue a period in which the whole setup is disrupted by captious criticism and bickering which render the commission powerless. At such times, even the common device of executive sessions in which differences are thrashed out fails to preserve the efficiency of the commission as a supervising body.

The manager plan, now in vogue in over 450 cities of over 5,000 population, returns the council to its proper function of a legislative or policy-determining body without depriving it of ultimate control over the administration. Its members are not expected to interfere in the operations of the manager or his department heads. In fact, in some charters they are forbidden to do so. Generally speaking, the council makes few appointments in addition to that of the manager himself. There are no committees except for the study of special subjects. Much of the business to be done is carefully prepared in advance by the manager. The task of being a councilman is less onerous than under other forms of government and more satisfying, since, through the manager the council exercises an effective control over the whole city government. It has therefore been found possible to induce a high grade of citizen to seek election to the council, in spite of the fact

that where councilmen are paid at all, the amount is usually a nominal one. The highest salary paid is \$5,000 in Cincinnati. The median rate of pay is \$1,500 in cities of from 250,000 to 500,000, \$980 in cities of from 100,000 to 250,000, and drops rapidly to \$66 in cities of from 5,000 to 10,000.

The size of the council varies somewhat, the range being from 20 to 2. The most frequent number is 9 in cities of over 100,000, and 5 in other places. The mayor, who is merely a presiding officer and ceremonial head of the city, usually is elected by his colleagues, but in some cities the candidate for council receiving the highest number of votes automatically becomes mayor. Elections in 82 per cent of the manager cities are on the double-election non-partisan plan elsewhere described. Councilmen are elected at large in 72 per cent of the cities with the manager plan. It is sometimes objected that at large election tends to produce a council all of one kind. In some 70 per cent of city manager cities this result is somewhat modified by electing part of the council at one election, and the remainder at the next. The term is usually either two or four years, the former being preferred in 42 and the latter in 44 per cent of all cities of this class. Proportional representation by the Hare or single-transferable-vote plan is in use in a few cities, the most notable of which is Cincinnati. Apart from its other merits which are urged by many students of city government, it is the most practical device for avoiding the one defect of at-large election, that is, getting a council all of one political persuasion. See also MUNICIPAL GOVERNMENT, AMERICAN.

General Character of American City Councils.—No one familiar with the development of American city government over the last half century can fail to recognize the great and fundamental change which has taken place in city councils. Fifty years ago city councils were large bodies—frequently two large bodies—almost invariably elected by wards on a partisan basis, with nominations in the hands of unregulated party caucuses. The result was that American city councils became a byword for incapacity and corruption. It would be too much to say that all city councils today are capable and honest. However, most of them, are so. Decent election and registration laws, regulated primaries where partisan elections continue to be used, and well protected nonpartisan or proportional-representation elections elsewhere have had their effect. Still more important is the more clearly defined responsibility which attaches to the members of smaller bodies, and the higher qualities which are required for election from a city as a whole. With some exceptions, American city councils compare favorably today with similar bodies the world over, not merely for honesty but for the ability and dignity with which they perform their duties.

THOMAS HARRISON REED.

CITY DISTRICTS. See DISTRICT.

CITY MANAGER PLAN OF GOVERNMENT. This form of government for cities, which made its first appearance at Staunton, Virginia, in 1908, and was fairly launched by its adoption by Dayton in 1913, in the succeed-

ing generation has passed well beyond the stage of experiment. By the end of 1948 it was in operation in 856 local communities. Most of these were in the United States, but the plan has invaded Canada, Ireland, and Puerto Rico. It has been adapted to the needs of numerous New England towns, and applied in more than a dozen counties. During this same period only 38 communities have abandoned the manager plan, usually because of the hostility of the local politicians. Not a single year has gone by since 1914 in which the number of cities with the manager plan has not substantially increased and, what is even more significant, its rate of adoption has been greatly accelerated in recent years. There were 76 adoptions in 1946, 79 in 1948, and 77 in 1949, a total of 232 in three years. This is impressive when it is considered that the average annual rate of growth for the 26 years from 1914 to 1940 scarcely exceeded 20. This continued and accelerated popularity indicates that the manager plan is here to stay.

The place occupied by the manager plan in American city government is indicated by the following table derived from the International City Managers Association's *Municipal Year Book* for 1948:

Population group	Number of cities in group	Number with manager plan	Per cent with manager plan
5,000-10,000....	962	157	16.3
10,000-25,000....	662	150	22.7
25,000-50,000....	212	58	27.3
50,000-100,000....	106	32	30.2
100,000 & over....	92	20	22.8
All cities of over 5,000.....	2,034	417	20.5

It is especially significant that the conquests of the manager plan have been relatively more extensive in cities of substantial size than in the small semirural communities. The manager plan has grown at the expense both of the independent executive type of city government and the commission plan. The steady increase, however, in the number of small municipalities in which the weak-mayor subtype is predominant keeps that form of government numerically about where it was in 1920. The commission plan has lost ground steadily, there being, at the close of 1948, scarcely 300 cities of over 5,000 population with that form of government. It will be remembered that the Des Moines plan, a commission government on the Galveston model, with the initiative, referendum, recall, and nonpartisan majority elections added, swept the country in the ensuing years. It is a point worth noting, therefore, that Des Moines, by vote of her people, abandoned the commission for the manager plan in the spring of 1949. Among the cities adopting the city manager plan in 1947 were those conservative state capitals, Hartford, Conn., and Richmond, Va., the latter making the jump directly from a two-chamber council.

The reasons for the success of the city manager plan of government are not hard to find. It provides for the government of a city the simplest and most effective form of organization the organizing genius of America has produced—a board of directors to make policies and a

professional executive to carry them out. This is the form of organization familiar in the private business corporation and also in the management of universities and other public institutions. The city council is of board-of-director size, nine being the prevailing number in cities of over 100,000 and five in smaller places. In better than 72 per cent of cities with the manager plan, it is elected at large to ensure a broad-gauge city-wide point of view in its deliberations. In 82 per cent of cities with the manager plan it is elected on a nonpartisan ballot. This does not exclude politics from council elections but it does give the independent voter a chance and keeps the party leaders on the alert.

The council so elected chooses the manager who serves at its pleasure and to whom is entrusted the entire task of administration. From his knowledge of the needs of the city he suggests policies to the council which it usually adopts, but the decisions are its decisions and not the manager's. Whatever the council decides the manager loyally carries out so long as their mutual confidence continues. When he ceases to have the confidence of the council or the council overrides him on matters he considers vital there is a new manager. When the manager plan is proposed in a new city, the cry is often raised that the city manager will be a dictator. That is untrue. The center of the manager plan is not the manager but the council. The manager has broad powers but they are held at the will of the council, and he is constantly under its supervision and control.

The city manager is generally a professional official in the same sense as is the superintendent of schools. Most charters and state optional acts providing for the city manager plan contain a special provision that the manager need not at the time of his appointment be a resident of the city or state. The practice of appointing "outsiders" is common and increasing. Many of the earlier city managers were engineers, and in small cities which carry on public utility enterprises, there is still something of a premium on engineering training as a qualification for the managership. Today, a city of any size looking for a city manager has a number of managers with previous experience in other cities to choose from. The city managers have a well staffed professional association—the International City Managers Association. It has evolved a code of ethics and publishes annually, a most useful compendium of information concerning municipalities of all types in the United States, the *Municipal Year Book*. Fortunately the salaries paid managers—\$15,000 to \$25,000 salaries are now common—have been high enough to attract the attention of ambitious young men toward the managership as a profession. Several universities now offer graduate curricula in public administration, one of the chief activities of which is training men for city managerships. Coupled with the numerous opportunities for "internship" in city government, the supply of manager material is thus constantly being supplemented by young men with excellent academic backgrounds.

In the early years of the city manager plan the turnover among managers was startling. The statistics of the *Municipal Year Book* have shown a steady improvement, and the job can now be regarded as being as stable, as any pub-

lic position not protected by civil service can be expected to be. Many men have now had long and successful careers as managers in a succession of cities. A few have spent their active lifetime chiefly in one city. It would be too much to say that politics does not enter into the appointment of managers in some cities, especially when the choice is a local man, but, in general, managers are appointed on their merits. There have been a few instances in which a manager has been the tool of a machine, notably Kansas City in the days of the Pendergast machine, but, generally speaking, managers carry on as could be expected of professional men seeking to improve their professional reputations. Kansas City, incidentally, has completely redeemed itself by making a record success with a first-rate manager from out of town.

There is an obvious advantage in having at the head of the city administration a man whose profession is city government. Even a moderate sized city in these days is a complex mechanism with many technical problems of which the average layman who may be elected mayor or councilman has no knowledge. A full-time manager, familiar with all these problems, can supply the skilled direction which is needed. All his self-interest is enlisted on the side of doing a good job which will advance him in his profession, normally by getting him a better job in some other city. This is in marked contrast to the politician's disposition to entrench himself politically in his home town.

One of the byproducts of the city manager plan of government has been the use of improved financial procedures. Most fundamental of these improvements is sound financial planning or budgeting. In all city manager cities a detailed estimate of receipts and expenditures for the conduct of the city during the ensuing year is prepared by the manager for the consideration of the council. As soon as adopted, an allotment plan is set up, apportioning the amount of each appropriation which may be spent in each monthly or quarterly period. To further secure the faithful carrying out of the budget as adopted by the council, city manager charters usually provide that no obligation to spend money can be incurred until the chief financial officer of the city has certified that there is an unencumbered balance in the appropriation applicable to that expenditure. In the opinion of most authorities on municipal finance, this officer should be appointed by the manager and should be the head of an integrated department of finance, including accounting, assessment of property for taxation, tax collection, and purchasing. Centralized purchasing has proved advantageous not only in avoiding waste, but as a means of administrative control over the numerous departments and agencies of large cities. Modern machine operated accounting, which permits the exact condition of every fund and appropriation to be available at all times, assessing on scientific principles, and effective tax collection machinery are found more frequently in connection with the city manager plan than any other form of local government. Altogether, improved financial practices, though they attract little popular attention, have had much to do with the success of the manager plan.

So far, only one city of over 500,000 population—Cleveland—has adopted the manager plan, and Cleveland has abandoned it. This

reticence on the part of the largest cities raises the question as to the adaptability of the manager plan to large city conditions. It is sometimes urged that a large city needs a political leader at the head of its government if public opinion is to be properly marshalled behind the activities of the city. There is certainly no other reason for rejecting the city manager plan as inapplicable to large cities. A centralized executive is even more necessary than in small cities and a professional administrator obviously could handle the details of the job as easily as an elected mayor. Probably the real reason for the absence of the great cities from the list of city manager plan cities is the strength in them of the political machines which almost uniformly have been hostile to the city manager movement.

No statistical demonstration of the superior results of city manager government is possible. Conditions vary so much from state to state and city to city that comparisons based on tax rates or government cost payments are almost always unreliable. Responsible students of municipal government never use them except as warning signals of possible extravagance. The best test of the city manager plan is to be found in its steadily increasing acceptance in smaller cities. The city manager plan, of course, is not an automatic guarantee of good government. It is, at most, merely a better mechanism for securing good government than the other current forms of city government in the United States. Like all other mechanisms its successful use depends on the wisdom and skill of those who operate it. It is the chief claim to credit of the city manager plan that it brings the two elements essential to successful administration in a democracy—popular representation and technical skill—into such a favorable relation as to produce a better average of results than any other system.

THOMAS HARRISON REED,
Municipal Consultant, Wethersfield, Conn.

CITY OF BROTHERLY LOVE (Gr. *φίλαδελφία, philadelphia, φίλος, philos, dear, and αδελφος, adelphos, brother*). William Penn gave the English rendering of the two words as the name, Philadelphia, to a city in Pennsylvania. The common rendering into English of the name of the city is City of Brotherly Love.

CITY OF DAVID, Bethlehem (modern Beit-Lahm, house of bread), supposed to be the birthplace of David, the place where his descendants had to go for the enrollment, when the census was taken by order of the Roman emperor. Jerusalem is sometimes called the City of David because he captured it from the Jebusites and made it the capital of his kingdom.

CITY OF DESTRUCTION, The. In Bunyan's *Pilgrim's Progress* Christian begins his journey at this city and journeys to the Celestial city. The place of beginning represents the world with its temptations, and the place of ending, Heaven with its joys.

CITY OF DREADFUL NIGHT, The. This well-known poem by James Thomson was first published in *The National Reformer* in 1874, under the initials B. V. for Bysshe Vanolis, Thomson's nom de plume. The work is the most

remarkable example in English literature of the unrestrained expression of intense and overpowering gloom. It has appropriately been called a "litany of pessimism." The author writes

"Because a cold rage seizes one at whiles
To show the bitter, old and wrinkled truth,
Stripped naked of all vesture that beguiles,
False dreams, false hopes, false masks and modes of youth."

His words are addressed not to the happy, not to "those pious spirits with a God above them," not to optimists who look for a heaven upon earth, but to desolate and fate-smitten sufferers like himself who see no ray of hope. The City is life—somber, desolate, a hell on earth. It is empty, save for wretches who move to and fro in the gloom like specters, speaking as with one voice the message of despondency and woe. In a succession of vague incidents, which give forward movement to the meditation, the poet encounters one after another of these shadowy figures. He hears a sort of atheistical sermon preached from the dark pulpit of a cathedral to a vast congregation of "spectral wanderers of unholy night," counseling despair and suicide. The poem closes with a memorable description of Dürer's *Melancholia*, whom Thomson makes the presiding goddess of his doleful city.

False as the note of unrelieved pessimism may sound to healthy ears, there is in Thomson's poem an unescapable appeal, due partly to the author's compelling power of imagination, partly to his mastery of the cadences of verse and partly to the very intensity of his mood. The atmosphere of gloomy mystery and the deep intonations of language in *The City* are said to owe something to the poetry of Poe; its melancholy is "compounded of many simples." Yet Thomson's poem remains not only highly original but unique. Thomson's poems were published in collected form by Reeves and Turner in 1880; for comment consult Walker, *The Literature of the Victorian Era*, and Stedman, *Victorian Poets*.
JAMES H. HANFORD.

CITY OF ELMS, New Haven, Conn., so called because of the numerous elm trees which shade its streets.

CITY OF GOD, *The*, a noted work by St. Augustine. This, the most important of all the saint's writings, was begun in 413, three years after the capture and pillage of Rome by the Visigoths under Alaric. The pagans had endeavored to show that this calamity was the natural consequence of the spread of the Christian religion, and the main purpose of Augustine is to refute them. The work was finished about 426 and comprised a total of 22 books.

CITY OF MAGNIFICENT DISTANCES, *The*, a name given to Washington, D.C. When the city was planned, the last of the 18th century, the long and broad streets, with here and there small parks, almost all of which were out long distances in broad fields, caused this name to be given to it in derision. Now its citizens are proud of the title.

CITY OF OAKS, a name given to Raleigh, N. C., from the size and beauty of some of the oak trees which adorn its streets.

CITY OF PALACES, a name applied to Calcutta, India, from the numerous palacelike edifices.

CITY OF THE PLAGUE, *The*, the name of a poem written by John Wilson (Christopher North), published in 1816. It is said to have been founded on the *Journal of the Plague in London*, by Defoe.

CITY OF THE PROPHET, Medina, Arabia, to which Mohammed fled from Mecca in 622.

CITY OF THE VIOLATED TREATY, Limerick, Ire., so named on account of the frequent infringements of the "Pacification of Limerick," concluded in 1691.

CITY OF THE VIOLET CROWN, Athens, Greece, the violet being the symbol of that city.

CITY PLANNING IN THE UNITED STATES. This article treats the history and the modern trends of city planning.

History.—City planning is probably as old as urban civilization itself. Once man began to build permanent settlements, problems arose which required thought for the future use of land and the establishment of safeguards for those uses. Common and unimpeded access to the water supply was in all likelihood the first and most imperative of these needs. The well was not the property of any one man, but of the community, and paths and roads leading to it likewise were common property. Certain plots of land became the property of individuals, whose rights to the land required description and definition. Reconciliation of the two uses, public and private, were the primitive bases of city planning. The physical fact and the legal status grew together.

The increasing complexity of permanent settlements makes it appear that certain decisions, that is, planning, must have been made in every city which ever has existed. The degree to which that planning was carried varied and no doubt depended largely on the degree of organization in the civilization which produced it. Certain very ancient cities show a very high order of planning, while others exhibit only rudimentary street patterns.

The accumulation of wealth in cities made defense against the attack of predatory bands another reason for planning; indeed the protection afforded by cities was one of the reasons for their growth. As nations increased in power and warfare became more purposeful and better organized, the importance of defensive planning increased. Most cities, besides being sources of loot, were also strategically located in respect to natural trade routes. They had grown naturally at such points, because trade was their primary function. Two types of cities, broadly speaking, therefore came into being. One was the hilltop city, the defensive power of which was concentrated in the compact citadel perched on a crag, the city itself being only partly protected. The other type was the city of the plain, usually surrounded by a wall. The planning was aimed, in the first instance, at permitting the citizens to get quickly into the citadel; in the second instance it was directed at getting the citizens to their fighting positions at the walls.

Thus accessibility of land for public functions and uses, the definition of land for private use, and the defense of both were the key problems from which city planning had its beginnings. By

the time when the great classical cities developed, another element of great importance had appeared—the element of civic pride. The rulers of the cities of antiquity wished to leave behind them monuments to their power and beneficence. Nor did large municipalities governed by aristocrats or oligarchs or democrats yield to cities controlled by kings or tyrants in their attention to building programs for utility or beauty. Great buildings and works of art arose, requiring splendid settings; plazas and forums for public meetings and the processions of armed might; temples, palaces, colonnades, and basilicas. City planning was architecture, and architecture was city planning. How closely these arts were related is clear in the remains of the Acropolis of Athens, in the ruins of Persepolis, in Rome, in the remnants of any ancient city in any part of the world.

The idea of the planned city was carried over Europe by the Roman legions, whose camps were constructed in quadrangles according to military directions which must have been very similar to those under which modern army camps are built: the cutting down of all trees and laying out of all structures in strict alignment, with wide roads for the massing of troops.

This Roman plan underlies many Continental and English cities, although in most cases the original regularity has been lost in the medieval confusion of narrow ways and densely crowded houses. The medieval pattern was quite different from the Roman because the method of warfare was different. The highly organized Roman legion disappeared after the fall of Rome, and centrally directed warfare on a large scale did not reappear until early Renaissance times. The cities of the Middle Ages were very small, very compact, hardly more than clusters of houses around the base of a fortress. Even the large cities, such as Paris and London, were limited in extent, and the land within the walls was utilized to the last square foot. Nevertheless the medieval city was also planned in its principal features. The principle of access for defense was still paramount, and the need for public approach to public spaces was not forgotten. The visual aspects of the cathedral or church were the main aesthetic considerations.

The transition to the Renaissance city, with its openness, its emphasis on the secular side of life, paralleled of course social, mercantile, and governmental changes. Riches increased, safety of person increased, while governments became stronger and more centralized. Perhaps most important of all, the new discoveries in mathematics, physics, and chemistry brought into use new methods of warfare, of which gunpowder and cannon were the new weapons of attack, the murderous product of a vast and far-reaching change in technology. The consequences for the city were the lowering of the walls, since the high masonry wall so effective against bows and arrows as well as the hand-to-hand attack were meaningless against the cannon and the gun. A new type of fortification was devised, and with it the new types of cities which would answer to the need for the mobilization of troops on a large scale: wide avenues, great plazas. Since again the rulers wished to commemorate themselves, civic buildings and palaces were designed to the scale of the great, wide avenues. Entirely new towns were built, completely planned, purposeful and self-contained, many of them beautiful in execution as well as conception. Some,

interestingly enough, were speculative ventures of princelings: homes and businesses in them were offered for sale in terms as glowingly deceptive as those of a modern subdivision.

The 17th and 18th centuries are the high-water mark of European city planning until the early 20th century, both in quality and in quantity. From it came the excellent early Spanish plans for Mexico City, Lima, Guatemala, Antigua, and a great many other cities of Latin America; and through other channels the fine plans of many northern colonial towns and of such occasional southern excellencies as Savannah, Augusta, and Williamsburg.

With the beginning of the 19th century the entire technological background of cities was changed by the Industrial Revolution. The pre-industrial cities were the product of civilizations which, while riches and well-being were not scorned, nevertheless attached many values to life other than material resources. The cities reflected this in a variety of ways; in the provision for the amenities of life, in a high regard for aesthetic values, in the relation of the urban complex to the rural scene. Much of this was unconscious; it was an accurate image of the spirit of the times. But the industrial city was no less an image. The growth of the use of money from a medium of exchange in the early days of the development of international trade to its complete domination of the mind and spirit of western man by the middle of the 19th century was paralleled by a degeneration of cities and by a deliberate spoliation of the urban idea, which was quite on a par with the spoliation of natural resources and with the degradation of the peasant and the craftsman into the slum dweller. Steam, smoke, and slums were the gift of the Industrial Revolution to the cities.

On the whole early American city planning had been excellent. The northern colonies followed the tradition of basing the economy of their towns on the use of land. The dwellings were collected around common lands, the farmlands were adjacent. Once the pioneering was done, there was no need for walls, and the towns grew spaciouly. When a community became too large for adequate intratransportation, new towns were founded. The southern tradition was slightly different, since it stemmed not from a democratic, puritan, agricultural background, but from aristocratic and liberal traditions to which was grafted slavery. The difference between Litchfield, Conn., and Williamsburg, Va., for instance, illustrates this. However, the influence of the southern tradition was limited, while the northern was spread throughout the Western Reserve and the territory adjacent to it.

A third influence became prominent after the city of Washington was designed by Major Pierre L'Enfant. This was the late Renaissance tradition, based on the effective placement of public buildings and on the connection of focal points by wide, radial avenues. Buffalo and Detroit show the traces of this influence.

When the United States really began to expand, and the westward march of industry began to follow the railroads through the wilderness, new cities were planned by the hundreds. They were laid out by surveyors and were deliberately planned for speculative expansion. The gridiron pattern of streets lent itself most easily for this purpose. In the first place, it is easy and quick to survey, since it is all straight lines and right

angles, and this matter of speed was of no small consequence. There were few surveyors and much work for them to do. Secondly, it provided the simplest method of lot description for sale and record. Thirdly, it provided an undifferentiated street system, an advantage because no one knew for what the land might be used—residence, business, or industry. For 50 years at least this surveyor's tradition was the dominant one in American city planning. Those were the years of expansion. Not only the numbers of cities increased, but also the older cities doubled and trebled in population from census to census. The swelling cities became choked with slums, built to house the immigrant workers, and some of these, notably in New York and in Chicago, became such breeding places of disease, crime, and human misery that efforts at reform were instigated. It was this revulsion against the slum that brought housing and the social aspects of urbanism into modern city planning.

A more direct influence for planning was the cumulative effect of rich and influential industrialists' visits to Europe and also of political bossism. The bosses had to have public works that they might have the proper source of illegitimate revenue. Many of our finest parks and public buildings are due to the most reprehensible characters. Like Julius Caesar, they sought to placate the public by gifts of parks and places of public amusement. The industrialists, returned from Haussmann's Paris, from Vienna, from Rome, felt the insufficiency of the gridiron and the cast-iron monument as an expression of a great and wealthy nation. In 1893 the White City in Chicago showed the people of the United States what could be done. The "City Beautiful" movement got under way. This movement lasted well into the early years of the 20th century. Its emphasis was on the outward aspect of cities, the civic centers, boulevards, plazas, the grouping of important structures, and the placement of monuments. Its inspiration varied from the "grand plan" of the French influence to the cottage village of the English. It completely ignored the economic aspect of planning and was unaware that there were social implications. Nevertheless it aroused the interest of great numbers of people and so prepared the way for the more serious planning which was to come.

During the 1890's abroad were important developments which eventually exerted powerful influences on American theory and practice. Camillo Sitte published his book, *The Art of Building Cities*, and Sir Ebenezer Howard published *To-morrow, a Peaceful Path to Real Reform* (later retitled *Garden Cities of To-morrow*). Sitte's book was effective only indirectly in this country. It was translated from Italian into French and was current in England, but not until 1945 was it translated into English and circulated in the United States. It was through European and English practice that his theories were spread. Howard was successful not only as a theorist, but two "garden cities," Letchworth and Welwyn, were built along the lines suggested by his book. Both works, in varying degrees, emphasize that city planning is planning for living and that social and economic considerations are of paramount importance. On the well-being of the citizen and his family everything else rests; his well-being depends on his ability to earn his livelihood and to rear his family in decent and healthful surroundings: this is Howard's theme.

Sitte develops the organization of the medieval city as a social-physical organism; its aesthetic unity is derived directly from the life of the people.

The first decade of the 20th century saw the beginning of modern city planning. As Professor Frederick J. Adams has pointed out, 1909 is a key year. It was in that year that the first British Housing and Town Planning Act was passed; it was in that year that the Chicago Commercial Club published the great Burnham Plan; and it was in that year that the first National Conference on City Planning was held in Washington, D.C., at which the participants laid strong emphasis on the need for economic studies in city planning and on the importance of comprehensive and coordinated treatment of city problems.

By 1916 the overcrowding of land in downtown New York City reached such serious proportions that the first zoning law regulating height and coverage of buildings and use of land was passed. The straw that broke the real estate interests' back was the Equitable Building, the size and bulk of which was an obvious threat to all buildings in lower Manhattan and to the physical use of the streets and to the transportation system. It was characteristic that all efforts to regulate use of land and to establish effective controls had failed until commercial interests were jeopardized; nevertheless the validity of zoning as a comprehensive method of control was established. It was the first step toward giving cities adequate planning powers.

World War I saw the application of English ideas to war-industry towns under the leadership of such architect-planners as Electus D. Litchfield, Frederick L. Ackerman, Clarence S. Stein, Henry Wright, and others. This work paved the way for Radburn, N. J., the first community planned in full recognition of the fact that the motorcar was here to stay. Thus within a score of years city planning took major and maturing strides in both its branches: the control of land uses in existing cities and the designing of entirely new communities.

Current Planning.—City planning in the mid-20th century is not concerned merely with the physical aspects. Important as these are, they are regarded as the purposeful end of a complex of many factors. Put in another way, the three-dimensional physical city is conceived as a means for accomplishing social ends rather than as an end in itself. As a practical matter, the economic status of a city must be included in the planning, since the social structure rests upon the economic base. A bankrupt-city can do little to help itself; a new town, without economic support, is doomed to failure.

The planning process for existing cities differs widely from the planning of new towns. Existing cities must be dealt with by amelioration. The emphasis is on trying to get each successive change in the city structure to be a part of a long-range plan for the general betterment of the community as a whole. The existing conditions of the city are analyzed and listed as a sort of civic inventory, and there is developed a program which, it is hoped, may in due time come to be realized, at least in part. In planning new towns the planner is reasonably free to use the newest ideas and techniques consonant with the sponsor's program.

The problems in existing cities, while varying widely in detail, are generally categorically simi-

lar. Congested streets, slums and blight, deteriorating business areas, worn-out public utilities, a strong tendency toward decentralization, and virtual bankruptcy are the major classifications. These ills have resulted from a variety of interrelated causes, most of them stemming from the technological changes which have occurred since the cities were laid out. Chief among these changes or, more properly, inventions are the internal combustion engine and electronics. The probabilities are that the technological changes inherent in atomic fission will prove no less a cause for obsolescence. The automobile has been a principal factor in freeing people from the congestion of the city. The movie, the radio, and television, added to the telephone, have released people from the necessity of being in a city for instruction and amusement or to maintain social and business contacts. Perhaps equally important is the higher standard of living, which has brought to many the realization that their children can have a better physical environment and a better education than the congested city provides. In the big city political corruption and educational stultification must be endured. The suburbs, smaller and with more human scale, offer greater opportunity for the individual to participate in local politics and in school control.

Congestion of traffic and overcrowding of land, that is, excessive population density, are both cause and effect. There is virtually no technical limit to the possible overcrowding of land. When, with a given sheet-pattern of limited capacity, the congestion becomes economically intolerable, a trend toward decentralization starts and the congested area begins to deteriorate. Frantic efforts then are made to solve the traffic problem. These efforts are, in general, hopeless, because the traffic problem is not a traffic problem at all, but a density, or population, problem. Any real solution is out of the question, because of the huge investment in real estate and in buildings, because of the consequent high land values, and because the tax base of the city is dependent on maintaining these values, no matter how fictitious. Redistribution of population and industry would seem to point to a solution, and this is also in line with the historical trend of technological changes.

The problem of the city planner is to deal with these matters as best he can.

Within our democratic framework the planner has various methods of approach and various tools which have been created by legal decisions over a considerable period of time.

The earliest effective tool, as previously mentioned, was zoning. This power rests on the concept of the police power of the state and depends entirely on the attitude of the courts toward the interpretation of "health and welfare." Zoning is now well established, although the extent of its power varies greatly from jurisdiction to jurisdiction. Widely regarded as a device for maintaining the status quo in land values and land uses, recent attempts by planners to give it a more dynamic use seem to be gaining ground in many communities.

Somewhat akin to zoning is subdivision control, which is a device for controlling the layout of undivided land. The alignment of streets, the provision of utilities (such as water, sanitary sewers, and storm drainage), the size of lots, provision for parking, and similar matters are controlled by the requirement that each subdivi-

sion must have the approval of the planning board before the plan can be filed for record.

Both zoning and subdivision control come under the jurisdiction of the planning board. Zoning variations, however, are usually handled by a board of appeals, or adjustment, whose powers are confined to "variation" or "adjustment" within the framework of the zoning law. Actual changes in the law are, of course, a matter of local legislative action, usually upon the recommendation of the planning board.

Both zoning and subdivision control suffer from the ignorance of the generality of officials appointed to administer them. Boards of zoning appeal are prone to yield to local pressures and often exceed their statutory powers in granting "variations," which in actuality are not variations at all, but changes in the law, which should be granted only by the local legislative body. While theoretically there is recourse to the courts for such illegal action, in practice the cost of court proceedings is prohibitive except in the most flagrant cases of abuse of power.

The weakness of subdivision control is that it controls neither the amount nor the location of subdividing. The abuse of this privilege by irresponsible speculators has resulted in literally hundreds of thousands of lots being thrown on the market, remaining unsold, and eventually becoming tax delinquent.

Planning boards, in general, derive their authority from the local legislative body within the framework of a state enabling act authorizing municipalities, and sometimes counties, to create such boards. They are appointive; the members are unpaid, except in New York City. To be at all effective, there must be a paid staff of men trained in the field of professional planning. If the board becomes politically objectionable, funds are withheld and the board becomes inoperative. The board's function is largely advisory, except in those places where they have very considerable power through the control of subdivision. Their principal activity is the preparation of a master plan, or comprehensive plan, which is intended to serve as a guide toward the development of a community. In a few states this plan can be adopted by the board after public hearings and, when so adopted, it becomes mandatory upon the local legislative body and the municipal departments to refer all public improvements to the board for approval. If the board disapproves, it requires more than a majority vote (usually three quarters) of the legislative body to override the board.

The master plan at one time was considered the main objective of city planning. It is now not so regarded. Many cities in the past acquired a plan, and there the planning ended. Present practice tends to view the master plan as only a preliminary step toward planning. It is a highly necessary step, because it gives the present picture and the objectives to be attained as of the present. Planning, however, is a dynamic process; the city grows and changes, and every municipal action has far-reaching consequences. The real task of the planning board therefore should be—and is, in those communities where planning is taken seriously—to serve as a research arm to the executive. "Pure" planning, planning according to theory, is a practical impossibility, for every executive decision is weighted by many factors of politics, expediency, finance, and local pressure. A conscientious executive and legislative body,

nevertheless, can be assisted greatly in making decisions, if presented with the full implications, city-wide, of the alternatives.

Because of limited powers planning boards must work closely with city departments and seek to have them forward overall planning objectives as part of their own departmental plans. The traffic problem involves, for example, a department of highways, the police department, and very often county, state, and federal departments or bureaus. These bodies may, and often do, have conflicting ideas, and the overall data of the planner may have significant effect on their determinations. Each of them is likely to approach a specific problem with professional bias to the exclusion of any collateral effects on the economic or the social structure of the city. Highway engineers, for instance, have little knowledge of and no regard for the economic or the social effects of their proposed alignments. It is the business of the city planner to take into consideration, insofar as possible, all relevant data and to present these impartially.

In matters affecting housing and clearance of slums the health department and the housing authority, if there is one, become involved. The selection of areas for clearance and the statistical incidence of disease, of crime, and of delinquency are all matters of importance to both bodies. The proposed density of new housing projects, their relation to traffic arteries and transportation, the provision of commercial facilities, and the existence or nonexistence of schools and of recreational areas are of prime importance in the general pattern of the city as envisaged in the master plan. It is for this reason, and because housing is the most potent factor in the realization of a "plan," that housing enabling acts almost invariably require a close connection between the housing authority and the planning officials.

School boards are usually autonomous bodies and accordingly jealous of their status. Cooperation between the school board and the planning board is therefore highly desirable; the guidance of the master plan data relative to population growth, the location of new highways, and other transportation changes are distinctly relevant to the building program of the school board.

With the growth of large-scale housing by institutions, such as insurance companies, an increasing number of states have laws extending the power of eminent domain for the benefit of such companies. In the majority of such laws the planning board is empowered to review site location, density, and other elements of the proposed project. Here again the objective is to safeguard the development of the city along the lines of the master plan.

In a few cities, notably New York City, the planning board reviews the budget of capital expenditures. In New York City the planning commission (the title in that city) actually prepares a five-year capital budget and sends the current year's budget to the board of estimate, which can delete but not add. Such procedure is rare; in general planning boards are limited to review and to making their recommendation or to silence.

The effectiveness of planning boards has grown since 1940 both in influence with politicians, who are responsible for the management of cities, and in legal fact. Court decisions in favor of zoning, of housing, and of parking authorities, and recently of redevelopment acts (to be discussed

later) have given them increasing power over a widening sphere.

On the social side the so-called neighborhood concept has been one of the chief developments. This idea was first clearly formulated by Clarence Perry and is based on planning neighborhoods within existing communities, each neighborhood to be centered around the school and to consist of a population large enough to support it. Each neighborhood would have its own shopping center and recreational facilities and preferably would also be a geographical entity separated from other neighborhoods by streams, main highways, parkways, or other barriers. It is part of the concept that such neighborhoods would help to resolve the overpowering largeness of the city, thus restoring, in some measure, individual initiative in local affairs, and recapturing for the individual the feeling of "belonging" which accompanies participation. The objections to the concept, when taken too literally, are that the population required to support a school is far too large for neighborliness in the true sense, that the area of such a district is too small for satisfactory planning, that most school districts are not related to geographic entities, and, more important, that there is no evidence that such planning would achieve the social objectives expected of it.

In fact it may be said that the social sciences so far have contributed little to the city planner. There have been studies of certain limited aspects, on a minor scale, by the late Professor Edward Lee Thorndike, Professor Stuart Chapin, Professor Svend Riemer, and a few others, but even these have been directed more toward housing than toward city planning. Sociologists should develop new techniques for the study of the social effects of such factors as physical patterns of communities upon social attitudes, relation of work to residence, lack of trees and of green areas, and general detachment from the sense of natural cycles, whether neighborhood community facilities do or do not alter the social pattern.

Study is also needed concerning the causes of growth of cities and of urban areas. There are studies of population growth by Professor John Q. Stewart of Princeton and the late Professor George K. Zipf of Harvard, which attempt to analyze demographic factors on a mass-statistical basis. These studies are promising, but wider research and much more interpretation are necessary before they will be of value to the city planner concerned with specific problems, since, as with all mass data, their value becomes less and less the more particular is the application.

Studies in the social and demographic field undoubtedly will be forthcoming, for the growth of what Dr. Don Bogue has termed the metropolitan community is of ever-increasing importance. The influence of the central city over the surrounding region is ever more powerful despite the fact that in many ways the central city is disintegrating. The resulting conflict in planning objectives cannot be rationally resolved until the forces at work have been subjected to much closer analysis and their effective implications have been brought at least into the form of a working hypothesis. Until such hypotheses have been formulated and tested, there is no basis upon which the planner can decide whether the process of decentralization should be accepted as inevitable or whether redevelopment, as the term is currently used, does or does not make sense. It

is probable that this absence of social data, as related to physical planning, is the reason for the lack of a sound philosophical approach to city planning as a whole and accounts for the failure of planning, at this time, to be much more than a series of expedients.

Traffic and Transportation.—This is the foremost problem of every city. Efforts to deal with it consist of street widenings, separation of through traffic and trucks from local traffic by designating certain routes, prohibition or limitation of parking. Recent more drastic measures have been to build through highways in such a fashion as to avoid intersections; for the municipality to acquire and to operate parking lots; and to require, by zoning, provision for off-street loading and parking for new traffic generators. The upcurve of automobile production and of owners' trip per capita, the increase in population, and the failure to recognize the relation between traffic and land use make most of these efforts abortive. In very large cities the lack of any correlation between places of work and places of residence is an added factor to transportation difficulties, and the increase in commuting is rapidly creating virtually insoluble problems of terminal trackage for the commuter railroads.

Slum Clearance and Housing.—Slums are more recognized as both a social evil and an economic menace. The areas of slum and blight in the majority of cities has reached proportions far beyond that with which the city is able to deal; hence the acceptance of public housing as a step toward civic improvement. However, neither public housing alone can begin to utilize all the areas needing clearance nor can the cities afford to purchase and to clear these. It is doubtful if intensive economic use ever can be made of all the land needing redevelopment. New concepts of density, taxation, and city patterns must come into being before the answers to this problem can be found.

Taxation and Budget.—The cities are finding it more and more difficult to raise sufficient funds for municipal services. The demand for social services of various kinds continues to increase also, largely due to the rising standard of living and to the fact that, as our civilization becomes more and more highly technical and specialized, more and more things formerly furnished by individuals or families for themselves cannot be so supplied and become the concern of government. Coupled with this is a declining tax base due to the flight of people, business, and industry from the central city. It is quite evident that the conventional methods of real estate taxation cannot meet this problem.

Public Utilities.—By this is meant the basic city services of sewers, storm drainage, water, streets, garbage collection, and, in some cities, gas and electricity. The cost of expanding these services is an important capital item related to the uncontrolled expansion of cities. In many cities maintenance is also a serious item because of wear and tear and obsolescence. In general, however, water services usually pay a profit, as do sometimes the gas and electric services. The planner therefore is concerned principally with control of expansion and with the purpose of securing an even growth of sewers and streets

without having to cross wide areas without population.

Industrial Development.—The proper provision of suitable areas for industrial expansion is an important part of city planning. In the past, industry first pre-empted water-front property

usually was relegated to any land not considered good for anything else. As a consequence of the use of motor trucks, of electric power, and of the assembly-line technique, industry is no longer tied to the railroad; it is not a dirt and smoke generator; and it requires more horizontal space. The reorganization of industrial areas in relation to places of residence, to arterial highways, and to allowance for plant expansion and for parking is now recognized.

Schools and Recreation.—The character of schools is changing rapidly. The one-story school properly oriented for sun, related to the scale of the child, and with large outdoor play areas is supplanting the three-story "monument" with an asphalt yard. There is a growing use of the school for adult education and for community use. Planners and educators are realizing the importance of acquiring large sites well in advance of population growth, and in this the planner can advise the school board of trends and of plans for such population generators as new highways or industrial locations. Parks and playgrounds, usually in charge of a separate city department, are in somewhat the same category and often are operated in cooperation with school facilities.

Airports.—The location of airports requires much study. They require large areas of land; the clearance for take-offs and landings create problems of zoning. Quick transportation to the center of the city must be provided, often by new highways. The effect of the noise from the planes upon property values, or of the hazards of crashing, have not as yet been determined to any considerable degree. It seems probable because of the certainty of great technical improvements in airplanes that whatever is planned now will be obsolete in the near future. Indeed, most of our airports already are at least obsolescent.

Zoning and Subdivision Control.—These are tools which the planner must keep sharpening and which various pressure groups keep trying to blunt. His problem is to convince the public and the city council that they are not instruments of repression, but are for the guidance of population growth and for the distribution of the various principal uses of land and consequently help the economic functioning of the city as a whole.

Public Relations.—Planning, to be effective, not only must be accepted, but also understood and supported by the influential people of the city. Ideally, the members of the planning board itself, or at least the chairman, should be the ones who establish relations with the public through the press and through civic organizations. Too often they tend to allow this important task to be relegated to the director of the technical staff, whose business should be planning, not speechmaking.

Redevelopment.—This will be discussed later in this article.

New Towns.—No less important for the future is the growing interest in what the English call the "New Towns" movement. Here, too, there is historic background. As previously observed, the expansion of trade and international war in the mid-17th century saw the founding of a very great number of new communities and the

remodeling of many others for defense against the new weapons of the period. Some of the towns were exceedingly beautiful. There were books on the theory and practice of town planning, based on a variety of concepts, both aesthetic and military, usually derived from some geometrical or mathematical formula. Because of technological limitations, largely in the fields of transportation, logistics, and other military considerations, these towns were limited in size. Many of these towns still exist, but in most cases they have disappeared in a morass of industrial slums, have overflowed their boundaries, and have lost their original character.

The modern New Towns movement may fairly be said to have commenced with the publication of Sir Ebenezer Howard's *To-morrow*. There were, of course, forerunners, at least in the general social theory. Robert Owen in the early 19th century was one of these forerunners, as were the founders of various utopias, such as the Fourierist colonies, the Oneida colony, and others. It was Howard, however, who first expounded the full theory of the satellite city, planned for living and working, limited in size by an inviolable agricultural greenbelt, properly related by transportation systems to other cities of its class, all of them related to the central city. The time was ripe for such an effort, there was current revulsion against the horrors of the slums of industrial England and against the filth and the grime which pervaded all except the wealthiest sections. Two towns, Letchworth and Welwyn, were built during the enthusiasm for Howard's ideas, under the technical guidance of Louis de Soissons and Sir Raymond Unwin.

The movement was brought to the United States by a group of men under the leadership of Alexander M. Bing, a New York real estate investor. The eventual result was Radburn, N. J., for which the site planner and architects were Henry Wright and Clarence S. Stein, together with Frederick L. Ackerman. Radburn, designed as a self-contained satellite to New York, marked the beginning of public realization of how a town could be designed for modern methods of transportation and living.

There had been many self-contained residential communities, mostly built for or around a particular industry, but they failed to consider the automobile as the primary factor to be dealt with. Yorkship Village, near Camden, N. J., built for shipworkers during World War I and designed by Electus D. Litchfield, was one of the best. Others were Longview, Wash.; Alcoa, Tenn.; Kingsport, Tenn.; Kohler, Wisc.; Mariemont, Ohio; and other, smaller, strictly "company towns."

Radburn, like its English prototype, failed to realize its sponsors' hopes of becoming a completely self-sustained community. Since industry was slow in coming, it turned into a dormitory town. Its essential planning characteristics, however, proved their worth, notably the superblock, the cul-de-sac and narrow "loop" lane for residential traffic, and the provision of community amenities and "built-in" safety for children.

Other contemporary developments were taking place in Germany under the leadership of Ernst May in Frankfurt, in Holland under J. J. P. Oud, Arie Keppler, and others. Le Corbusier (real name Charles Jeanneret) was beginning in France to elaborate his theories of La Ville Radieuse, the city of far-spaced skyscrapers, a highly mech-

anistic concept which was to have great influence on the thinking of the younger generation of American architects and planners.

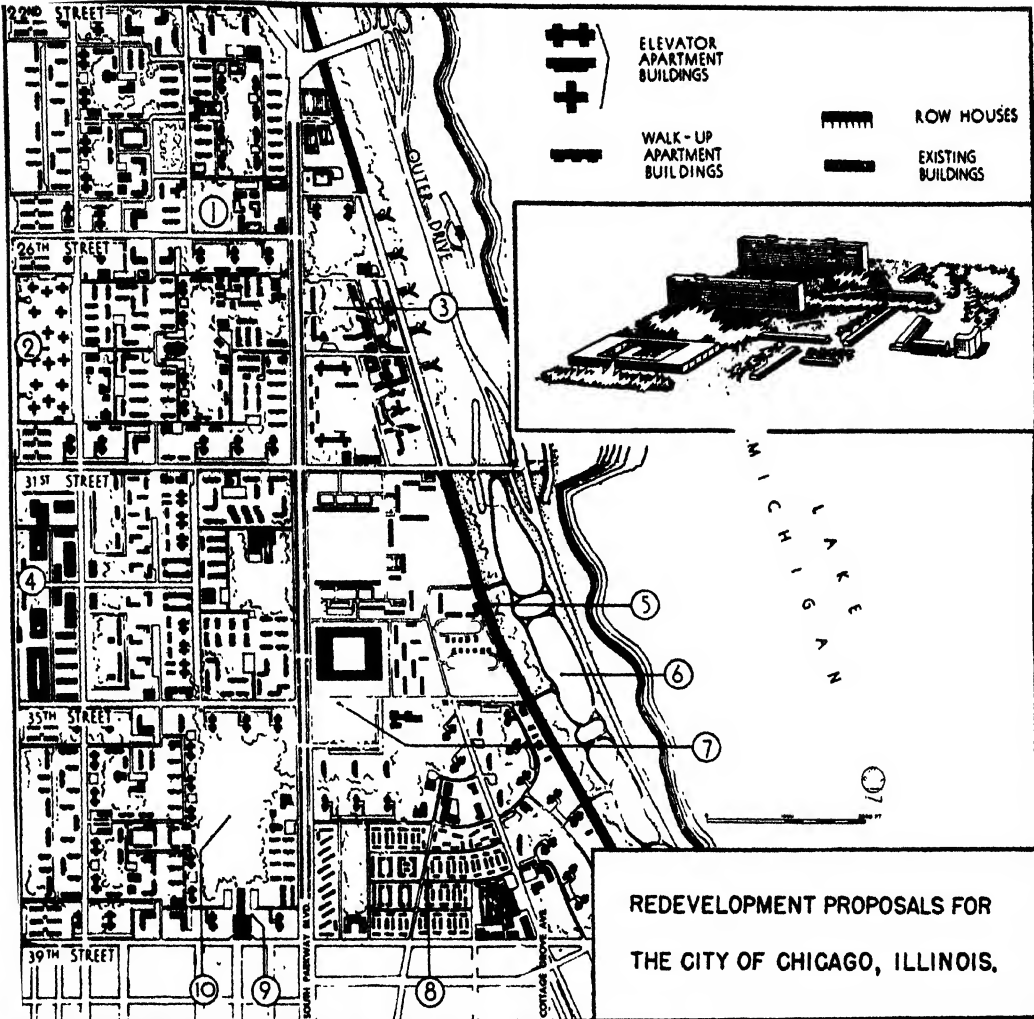

The financial depression of the early 1930's brought great strides. The emphasis on large-scale public housing introduced the notion of "the planned community" not only to the public but also, equally important, to the architects. It demonstrated vividly what was wrong with our cities as living spaces, and proved that there was the possibility of other and better ways of organizing them. The demonstration was carried into the New Towns field through the construction of the three greenbelt towns of Greenbelt, Md., Greenhills, Ohio, and Greendale, Wisc. They were planned and built by the Suburban Resettlement Administration as part of the pump-priming program of the New Deal. These three communities carried the Howard idea farther than it had been possible to do at Radburn and technically continued and further developed the "Radburn idea."

World War II advanced the techniques of new town planning through the many defense projects and towns, most of them temporary in nature, throughout the nation. Even though temporary in type of construction, town planning principles necessary to good circulation, safety, social amenities, and even aesthetic satisfaction were employed. Much was learned from them.

The issue in the mid-20th century is a conflict between the need for modernizing our existing cities and the need for controlling the unorganized sprawl which is the result both of the push from the city and of the great growth of the metropolitan areas by migrants from the country. While the ideal solution probably would be a series of self-contained, related, and well-organized satellite cities or "New Towns," this seems hardly probable of attainment. Other types of organization have been advocated, but, as long as there is cheap land to be exploited, any concerted effort to organize and to control development most likely will prove to be in vain. This is not to belittle the importance of the problem; urban sprawl very well may prove, in the future, to have been our worst crime in the wasting of natural urban-regional resources.

Redevelopment.—While we are permitting our suburban areas to become tomorrow's slums, we are struggling to find some method of doing over the slums and the blight left to us by our predecessors. The central portions of most cities began to deteriorate even before the advent of the automobile, as electric mass-transportation opened adjacent areas. The automobile accelerated the process and, as time passed and as the number of cars increased, the problems of traffic congestion and of parking brought more blight. Enterprising merchants realized that the outlying shopping center, built for cars as Radburn was built for cars, could prove profitable. The astonishing success of such centers, large and small, began to have its effect on downtown business. Industry, hemmed into undesirable sections of the city, unable to expand, its flow of materials hindered by traffic, also realized that outlying areas were more satisfactory places in which to locate. The effects of these various movements were interacting and cumulative. The cities were left with developed but obsolete areas, into which no one would invest money because no single enterprise could reverse the trend. Not only were the land valuations very high—para-

CITY PLANNING

An old plan of Charleville, on the Meuse River, France: a city of palaces, churches, and convents.

CITY PLANNING

Radburn, New Jersey: plan of the northwest and southwest residential districts. The essence of the "Radburn Idea" lay (1) in the use of large park areas in the centers of the "superblocks," which were designed to replace the traditional narrow, rectangular block; (2) in the differentiation of roads for specific purposes: through roads to other sections, collector roads around the superblocks, and service lanes for access to the buildings themselves; (3) in a separation of automobile roads from pedestrian walks, including the use of overpasses and underpasses; and (4) in the orientation of utility rooms, such as kitchens, toward the roads, while living and sleeping rooms faced the gardens and parks.

doxically often the most badly decayed areas were valued the highest—but also the multiplicity of small holdings made the acquisition of large plottage a virtual impossibility.

It was obvious that certain incentives would have to be elaborated to attract investment capital. The large insurance companies, desirous of investing large sums with a minimum of risk, were the first to evolve a tentative method of action. The success of New York's limited-dividend housing program pointed the way. The first redevelopment company laws were enacted to permit large limited-dividend projects to be erected with the equity money of insurance companies. They provided also for the exercise of eminent domain, for tax exemption of the improvement, for arrangements with the city for the closing of streets. In return, rents were limited.

Redevelopment laws soon were enacted in other states, broader in scope than the New York prototype. Finally, after two years of debate Congress passed the Housing Act of 1949. Title I of this act deals with the redevelopment on a national scale. Funds are provided from which loans and grants can be made to cities for acquiring land, demolishing the old structures, re-planning and selling or leasing for the planned purpose. The land may be sold for its "use value," and two thirds of any loss is paid by the government, the remaining one third being borne by the city. The stated purpose is for clearance and redevelopment of slums and blighted areas, but there is provision for loans, but not grants, for the planned development of open land. The object of this was twofold: mainly to provide funds for building the necessary and required rehousing of dispossessed families, and partly to be an opening wedge for the possible creation of new towns. The act requires: (1) either state-enabling powers for the creation of locally controlled redevelopment agencies or assumption of the burden by local legislative bodies, (2) conformance to an officially approved comprehensive plan for the future development of the city, (3) responsibility of private enterprise for carrying through the redevelopment. The federal powers are vested in a special division of the Housing and Home Finance Agency. The intent of the act is that all initiation and execution shall be at the local level.

The opportunities opened by this legislation are enormous. It remains to be seen how much will be done, and how well. There are certain obvious difficulties, the chief ones being whether the incentive to private enterprise will prove sufficient, whether the real estate market can absorb the new offerings at economic levels, whether the municipalities can meet even the one third of the write-off. These, of course, are economic questions; for the city planner the difficulty will be whether he will replan along the lines which the automotive and electronic age demand for decent living and working or whether he will be forced into a repetition of projects of high density, which will be obsolete before the work is started, by the dictates of an outworn system of speculative real estate practice and an ancient tax structure.

The ultimate success or failure of redevelopment will be a test of the modern techniques of city planning. In Philadelphia there appears to be a strong and persuasive current toward accomplishment. Over a period of years the various municipal departments and the public generally

have been convinced of the need for action. Citizen groups in various blighted areas have been encouraged to take part in determining the future of their surroundings. Intensive and valuable studies of social and business conditions have been made. In Chicago other methods appear to be having success. In that city the Michael Reese Hospital, once favorably located in the South Side, found itself isolated in a vast area of slum and blight. Instead of moving, it sought to be of greater service by trying to rehabilitate the environment. It organized a planning staff for this purpose, using its own expansion program as a starting point. Together with the expansion program of the Illinois Institute of Technology, the New York Life Insurance Company, and the Chicago Housing Authority, a large and comprehensive scheme for the rebuilding of a great segment of the South Side has begun.

San Francisco, Los Angeles, Detroit, Indianapolis, Providence, and many smaller cities have active redevelopment planning. New York City alone among the major cities has done little except to effect routine zoning changes. However, a comprehensive study, which is intended to lead to rezoning, was almost completed in 1950, and an era of greater official activity appeared there. New York City's problems are, of course, the most complex of any city's; on the other hand its planning commission has greater powers than those of other cities, and, if political difficulties, public inertia, and opposition of powerful interests can be overcome, great things may be expected from the rebuilding which occurs continuously in the metropolis.

Professional Progress.—These years of growth of city planning have seen the rise of a new profession, that of city planning. The early modern planners were recruited generally from the professions of architecture, landscape architecture, or civil engineering. The increasing complexities of the work have proved the need of special training. Knowledge is needed from many disciplines: architecture, engineering, economics, sociology, law, public administration, and public relations. The planner is not, and can not, be competent in all these; it is necessary, however, that he have knowledge of their general content, of their specific application to city planning, and of their relation to one another in civic matters. There are now courses leading to degrees in city planning in many of the principal universities. They are usually postgraduate; the recent trend is to accept a graduate degree in any of the related disciplines instead of requiring, as formerly, that the student hold a degree in architecture or in engineering.

Organizations concerned with city planning also have multiplied. The American Institute of Planners is the leading professional organization and publishes an excellent journal. Administrators and practitioners are together represented by the American Society of Planning Officials, an influential organization which renders informational and research services; there are many local or regional technical organizations. In addition there are local organizations of interested citizen groups in almost every large city. These perform public-relations services, act as sounding boards and pressure groups, and often initiate studies of specific problems. The growing interest in regional planning for metropolitan areas is evidenced by the increasing number of official or semiofficial bodies organized to deal with these intercom-

munity problems. The oldest and best known is the Regional Plan Association of New York, a private organization which was responsible for the first really comprehensive plan of New York City and its environs and which continues to develop cooperation among the various communities in the metropolitan region.

Summary.—City planning today, then, is not like the city planning of the past. It is concerned with broad objectives in many fields, not just with the physical aspects. Indeed the pendulum may have swung too far, for the present-day complete neglect of the aesthetic side of city planning may prove harmful in the future. Civic pride is an important factor in the psychology of any community, and civic pride is evidenced in the three-dimensional quality of the physical city. It is in this field that the architect must resume what, to specialized planners today, seems to be a disproportionate degree of control of the planning process, particularly at the point of actual execution. For the most part, however, planning is a work of coordination and guidance rather than of execution and administration. In our democratic society this often leaves the planner frustrated, because there is no direct way of attaining major objectives in the way in which Baron Haussmann attained them in Paris, or Pope Sixtus V and Mussolini attained them in Rome. Progress is made slowly. Momentum has gained, nevertheless, and the Housing Act of 1949 points the way to further action. It will be still increased as the plight of the cities increases and as need for redevelopment becomes imperative. Objectives will have to be clarified, and this is one of the major tasks of the new profession. Public and political acceptance of controls needs to be encouraged. New legal devices and economic reorganizations must take place. The results should be both cities rebuilt to new patterns and new towns in place of suburban sprawl. The basic financing should be the least of the difficulties, for we rebuild the United States continuously. It is a matter, primarily, of planning for the common good instead of allowing haphazard growth for the temporary benefit of a few. Such action must come from the people; it cannot be imposed from above. City planning today is, therefore, an integral part of the democratic process.

HENRY S. CHURCHILL.
Architect, City Planner.

CIUDAD BOLIVAR, syōō-thāth' vō-lē'vār, city, Venezuela, capital of Bolívar state, on the Orinoco, 240 miles from its mouth. It is an important river port. It has a hot, tropical climate. It is the focal point of the Orinoco River trade. The exports are hides, balata gum, tonka, beans, medicinal plants, chicle, indigo, woods, gold, and diamonds. The industries are saw-milling, rice milling, tanning, and the making of furniture.

It was founded in 1764, and named Angostura for its location on the narrowest point of the Orinoco. It played a major part in the struggle for independence. It was the site of the Congress of Angostura held in 1819, which, under Simón Bolívar, formed the Republic of Colombia out of the Spanish states of New Granada and Venezuela. Pop. (1941 est.) 19,764.

CIUDAD DE CURA. See VILLA DE CURA.

CIUDAD JUAREZ, syōō-thāth' hwā'rās, city, Mexico, on the Rio Grande opposite El Paso, Tex. (with which it is connected by an international bridge), in the state of Chihuahua. It was founded late in the 17th century. Formerly known as EL PASO DEL NORTE, it was renamed in 1888 for Benito Juárez, who found refuge here while most of Mexico was occupied by the French. Pop. (1940) 48,881.

CIUDAD PORFIRIO DIAZ. See PIEDRAS NEGRAS.

CIUDAD REAL, thyōō-thāth' rrē-āl', city, Spain, capital of Ciudad Real Province (7,620 square miles), near the Guadiana River, 99 miles south of Madrid. The notable Gothic cathedral of Santa Maria del Prado has only a single nave. Woolen and linen textiles and brandies are manufactured. Alfonso X (el Sabio) founded the town, which was known as Villareal until 1420. Near here, on March 27, 1809, the Spaniards were defeated by a French force. Pop. province, (1941 est.) 535,981; city, (1941 est.) 32,931.

CIUDAD RODRIGO, thyōō-thāth' rrō-thrē'gō, city, Spain, in Salamanca Province, on the Agueda River, 53 miles west-southwest of Salamanca. The cathedral, begun in 1190, has numerous interesting features. The city was occupied by the British in 1706-1707, during the War of the Spanish Succession; it was captured by the French under Gen. Michel Ney on July 10, 1810, and was taken once more by the British, under Viscount Wellington, on Jan. 19, 1812. For this success Wellington received an English earldom, and the Spanish Cortes bestowed upon him the title of duke of Ciudad Rodrigo. Pop. (1941 est.) 12,082.

CIUDAD TRUJILLO, syōō-thāth' trōō-hē'yō, capital of the Dominican Republic, is a

seaport on the south coast at the mouth of the Ozama River; until 1936 it was known as SANTO DOMINGO. The oldest continuous European settlement in the Americas, it was founded in 1496 by Bartholomew Columbus, brother of Christopher Columbus; a tomb in the Gothic cathedral (commenced in 1514) is said to contain the remains of the latter. Pop. (1948 est.) 147,372.

CIUDAD VICTORIA, syō-thāth' vēk-tō'-ryā, town, Mexico, capital of the state of Tamaulipas, 150 miles southeast of Monterrey. The town, founded in 1750, is the center of a sugar-growing region. Pop. (1940) 19,513.

CIVET, a family of small carnivorous mammals, the Viverridae, related to both the hyenas and the cats. Their alliance to the former appears when the fossil history of the family is traced back to the early Tertiary, where the ancestry of both converges. The comparatively coarse hair and erectile mane possessed by some species, and dentition, are still hyenelike; while the slender, elongated form, long tail, and, especially, the fact that the claws are semiretractile, exhibit the inborn likeness to the cats. The civets vary from two to three feet in length, and most of the species are strongly marked in black and white stripes and spots, sometimes prettily disposed. They are distributed throughout the warmer parts of the Old World. The family is divisible into two groups, one of which includes the typical civets; the African genets, one species of which also inhabits Spain and Italy; the linsangs and other Oriental spotted forms, and the paradoxures. The second group includes the mongoose and other ichneumons, suricates, and the like. These various forms will be found described elsewhere under their separate names.

Civets feed upon smaller mammals, birds' eggs, lizards, and snakes, and are considered beneficial because of their appetite for crocodile eggs, which they devour in great quantities along the Nile. They are characterized by, and chiefly valued for, an odorous, fatty substance, contained in a pouch connected with the sexual organs, in both sexes. This substance is used for compounding perfumes, and is ready for use after it has been drained, washed, and dried. It is called "civet." A dram is obtained at a time from each animal, from which it is taken at intervals of a few days.

CIVIC CROWN, among the Romans, the highest military reward assigned to him who had preserved the life of a citizen in battle. It bore the inscription *Ob civem servatum*, that is, "for saving a citizen," and was made of oak leaves. He who was rescued offered it, at the command of his leader, to his preserver, whom he was bound to honor afterward as a father. Under the emperors it was bestowed only by them.

CIVICS AND CIVICS TEACHING. Originally civics was concerned with government and the relations of citizens to government at its various levels. During the 20th century the term has broadened to include all aspects of citizenship: political, economic and vocational, social and ethical. School courses in civics, recently often named Citizenship, are now likely to include some aspects of psychology, attention to individual growth and adjustment, the role of

the individual in groups of all kinds, aspects of social psychology, including intergroup relations, and aspects of international organization and cooperation. School courses in civics accordingly have become offerings in general social studies, drawing not on government alone but on many social sciences. Increasingly they reflect the philosophy of general education—concern, that is, for the well-rounded development of every human being as well as for his growth in civic competence.

Much civic education in the United States has always been informal and gained outside school. In colonial times it was carried on in home and church, in election sermons and such newspapers as were published, at militia drills and in taverns—wherever men gathered. Through successive generations the greater and the more influential part of political education has gone on near the cracker barrel and street corner, in holiday observances and political rallies, in town meetings and in contacts with the local boss, in the gatherings of patriotic and civic organizations of both sexes and all age groups, in the press, the movies, and radio and television programs. Family background, including its nation of origin, economic interests and pressures, social status, and religious affiliation have all been significant in informal teaching of civics.

Explicit attention in schools to political education began very soon after the formation of the Federal Union. Textbooks both in American history and in government date from the early 1790's, though their use spread slowly. School readers, like the series edited by McGuffey, included much attention to heroes, dramatic episodes in history, and standards of personal and civic behavior. Until 1865 textbooks in American history reflected considerable sectionalism, though national and nationalistic attitudes gained steadily.

As public elementary schools were established from the 1820's on, American history, then predominantly political, constitutional, and military, became a standard part of their curriculum. The same was true of high schools, also first established in the 1820's, though their great growth has been since 1870. Nationalism and some realization of need for attention to the Americanization of immigrants stimulated local authorities to make national history, with its emphasis on the Constitution, political events, and American traditions and ideals, a requirement in the intermediate grades, again in the grammar grades (now included in junior high schools where these have been established), and for a third time in high school. Some colleges have required still another survey. Such requirements have been reinforced by legislation in more than half of the states and by the admissions requirements of colleges. Many states have also required the teaching of state history and government. Incidental, but far from negligible, contributions to civic education have been made by courses in ancient and English history (now merged in world history), in some literature read in English courses, and in school assembly exercises and observance of holidays.

Courses in civics or government alone have never received as much attention, either in time or explicit requirements, as has American history. Continuous and slowly increasing publication of textbooks on the Constitution or civil government indicates some school use of them through the 19th century. Their content, and the classroom

teaching based upon them, rarely went beyond factual data, mostly concerning the federal government, which pupils were expected to memorize. The flood of immigration, the extension of the franchise and democratic rights, and the appearance of organizations of professional educators, historians and political scientists resulted in demands for more systematic political education. A long series of investigations and reports sponsored by the National Education Association (1893, 1913, 1916), the American Historical Association (1899, 1908, 1911), the American Political Science Association (1908, 1916), the National Municipal League (1901, colleges; 1905, high schools; 1914), various regional organizations of history teachers, and the Federal Bureau (now Office of Education) resulted in more teaching of civics and broader concepts of its scope. The influential reports of the American Historical Association stimulated the allocation of at least one fifth of the class time in American history, in both grades eight and twelve, to study of American government; separate textbooks were usually provided. The College Entrance Examination Board reinforced the attention to civics by setting an examination on the combined fields of American history and civil government. Both the American Historical Association (1908) and the American Political Science Association (1908) urged attention to governments of town and city, state and nation, in the intermediate grades; the former believed that "elementary civics should permeate the entire school life of the child."

The American Political Science Association in both 1908 and 1916 recommended that a half-year course, or equivalent, in American government be offered in senior year of high school. The recommendation has been followed in many communities, especially since 1916 when American history began to be placed in grade eleven rather than twelve. The 1908 report also gave attention to teacher education, library resources of high schools, and the need for firsthand observation of government in operation and for reading newspapers and magazines. The report concurred in the view vigorously advanced by the National Municipal League, from 1901 on, that major attention be devoted to local and state government, both of which are closer to the citizen than is the national government. It reflected professional developments in the field of education, as well as a broadened concept of civics, in its attention to aims, social service, teaching methods and devices, and practice of active and responsible citizenship.

The 1913 and 1916 reports of the Committee on the Social Studies of the National Education Association's Commission on the Reorganization of Secondary Education set the pattern for social studies courses in grades seven through twelve that has since been most commonly followed. The reports emphasized effective citizenship as the central objective of all social studies instruction, to which geography and American history in grades seven and eight, a new full-year course in civics in grade nine, world history in grade ten, American history in grade eleven, and either a new full-year course in problems of American democracy or separate half-year courses in government, economics, and sociology in grade twelve, should all contribute.

The courses for grades nine and twelve, both as outlined in the reports and as they have de-

veloped in schools, reflect broadening concepts both of social studies and of civics. Recommendations of community civics and vocational civics for grade nine have continued to be influential, though guidance officers have increasingly taken responsibility for the vocational area. Textbooks and courses in economic civics, social civics, and citizenship have not neglected government and political citizenship, but have given attention as well to the role and responsibilities of all individuals in economic life, both as producers and consumers, and in social relationships, both as individuals and as members of many social groups. The same has been true of the grade twelve course in problems of American democracy (or problems of democracy or modern problems). Tables of contents of textbooks for the two grades, and topics or units listed in courses of study, have come to be very similar. Both courses draw on the fields of government, including international relations, economics, sociology, psychology, and social psychology, though boundary lines between the various subjects have become less and less distinct. Both offerings overlap the rapidly developing field of guidance in their attention to better individual adjustment. Both stress recent and contemporary affairs, as is true of courses in American and world history. Moreover, in all social studies classes, beginning with grade four, one period a week or the equivalent is likely to be devoted to current events; several weekly magazines published for the intermediate, the junior high school, and the senior high school grades are widely used, and some daily newspapers and adult weeklies publish study and teaching materials for classroom use.

The half-year course in government has by no means disappeared from grade twelve. It puts less emphasis, however, on encyclopedic information concerning forms of government and more on the purposes, functioning, and services of government, together with the responsibility of individuals for making democracy effective.

All courses concerned with civics have tried to relate their treatment to the firsthand experience of learners, to expand that experience through guided observation, and to encourage activities that involve participation in community affairs, youth organizations, and the conduct of classroom and school life. Many schools have sponsored trips to town meetings, other local and state legislative sessions, courts, banks and retail establishments, factories and assembly lines, and a variety of governmental, social, and civic-centered agencies. Some schools have deliberately expanded the powers of student-government organizations and student councils, encouraged such programs as those of the Hi-Y, 4H Clubs, the Junior Red Cross and Red Feather (Community Chest) agencies, and a variety of relief projects. They have cooperated in essay and other contests designed to promote patriotism, understanding of American traditions and ideals, and international understanding and cooperation. They have sponsored various community surveys and projects for community improvement.

Many organizations have concerned themselves with the subject matter and attitudes involved in education for citizenship. The Daughters of the American Revolution, the Sons of the American Revolution, the Grand Army of the Republic, the Confederate Veterans and United Daughters of the Confederacy, the American Legion, Irish-Americans, German-Americans, Polish-Ameri-

cans, Italian-Americans, Negro groups, the American Bar Association, the American Manufacturers' Association, the United States Chamber of Commerce, the American Federation of Labor, the Rotary Clubs and Kiwanis, the Knights of Columbus, the Masons and De Molay, the League of Nations Association and the United Nations Association, and a range of agencies of the federal government, in time both of war and peace, have urged attention to information or attitudes of special concern to them or have published materials for school use.

The rise of totalitarian governments and the coming of World War II stimulated review and improvement of the school program in civics and citizenship. Professor Charles E. Merriam edited a ten-volume series entitled *Studies in the Making of Citizens* and wrote the summary volume, *A Comparative Study of Methods of Civic Training*, (University of Chicago Press, Chicago 1931); the countries studied were Soviet Russia, Great Britain, the Habsburg Monarchy, Italy, Switzerland, the United States, and France; another volume was anthropological in approach. The Educational Policies Commission sponsored a study of better practices in American schools, published in 1940 under the title *Learning the Ways of Democracy*, and also published volumes concerned with economic citizenship, school administration in relation to democracy, social services, and moral and spiritual values in public education, together with a series of pamphlets for teacher and pupil use. The National Council for the Social Studies has devoted many publications and convention programs to aspects of the teaching of government and citizenship; the publications include a yearbook, edited by R. W. Crary, on *Democratic Citizenship Education* (1952). Other organizations of professional educators have been notably concerned with the broadening and deepening of the school program in citizenship.

In the years following World War II, numerous grants by foundations made possible systematic attacks on problems in civic education. The Civic Education Project (Cambridge, Mass.) undertook the writing and publication of attractive and readable booklets to fill a gap in teaching resources. The Detroit Citizenship Education Study investigated the behavior of children in a variety of environments, analyzed school experiences related to growth in citizenship, and developed a program involving school cooperation with parents, governmental and voluntary agencies, and representative citizens. The Citizenship Education Project at Teachers College, Columbia University, developed a cooperative program with school systems and teacher-education institutions in all parts of the nation; the project set out to identify and extend the use of more promising practices, to aid teachers in locating needed resources, to provide some new materials, and to improve ways of evaluating results.

Elementary as well as secondary schools have participated in developing school and community experiences that advance civic understanding and responsibility. The social studies program in primary grades helps children understand the home and community. Neither the primary nor the intermediate grades attempt to teach civics or government as such, but do attempt to develop understanding of social, economic, and political life insofar as the experience and maturity of pupils permit.

College offerings in government or political

science have been multiplying since the late 19th century. Fewer college requirements have been established in American government than in American history, but registrations in government offerings have been numerous in four-year colleges and junior colleges, and most undergraduates preparing to teach social studies in high school have been required to include at least a year of government in their program. Reports of the American Political Science Association have repeatedly stressed the value of offerings in American government, state government, and comparative government both in general education and teacher education. A few colleges, at least, have experimented with trips planned to provide opportunity for observation of government in action. Following World War II Dartmouth College instituted a course in Great Issues, required of all seniors, which is still unusual in its recognition of the responsibility of colleges in the education of undergraduates for competent democratic citizenship.

ERLING M. HUNT,
Teachers College, Columbia University.

CIVIDALE DEL FRIULI, chë-vê-dâ'lâ dâl frê'ôo-lê, (ancient FORUM JULII), town, Udine province, Italy, 9 miles east by northeast from the town of Udine. It consists of the town proper, surrounded by walls and ditches, and of fine suburbs; and has among its edifices a large cathedral of the 15th century, with three Gothic portals, a curious baptismal font and several fine paintings; a museum of antiquities, and a record office with some very ancient characters. The neighborhood abounds in interesting antiquities. The Natisone, which flows through the city, is crossed by a 15th century bridge. The modernized city has a military training college, and silk, cotton and linen factories. Pop. (1936) 4,715.

CIVIL ACTION, an action brought in the civil courts for the recovery or protection of private or civil rights, or damages for their breach. The two great classes into which actions are divided are civil and criminal. In civil actions either a government or a private individual may be plaintiff or defendant; while criminal actions are always brought in the name of the government.

CIVIL AERONAUTICS ADMINISTRATION, a bureau of the United States Department of Commerce. The Civil Aeronautics Act of 1938 created the Civil Aeronautics Authority, a successor to the Bureau of Air Commerce. As a result of reorganizations, the authority now exists only on paper. It is more accurate to refer to its two main parts, the Civil Aeronautics Administration and the Civil Aeronautics Board, a separate and independent organization (see CIVIL AERONAUTICS BOARD).

The administrator of civil aeronautics encourages and fosters the development of civil

aeronautics and air commerce; encourages the establishment of civil airways, landing areas, and other air navigation aids and facilities; designates and establishes federal airways; acquires, establishes, operates, and maintains air navigation facilities along civil airways and at landing areas; makes provision for the control and protection of air traffic moving in air commerce; undertakes or supervises technical development work in the field of aeronautics; and plans for the development of aeronautical facilities. The administrator also carries out civil aeronautics safety regulations (except the prescribing of safety standards, rules and regulations and the suspension and revocation of certificates after hearing), including effectuation of safety standards, rules and regulations; examination, inspection, or rating of airmen, aircraft, aircraft engines, propellers, appliances, air carriers, air navigation facilities, and air agencies; the issuance of emergency suspension of safety certificates, provides for aircraft registration and recording of title; recommends to the Civil Aeronautics Board proposed standards, rules and regulations designed to promote air safety; requires notice with respect to hazards to air commerce; and administers the affairs of the Washington National Airport. The administrator of civil aeronautics is appointed by the president with the approval of the Senate.

CIVIL AERONAUTICS BOARD, a board which performs its functions independently of the secretary of commerce of the United States. It is composed of five members, appointed by the president with the approval of the Senate, one of whom is annually designated by the president as chairman and another as vice-chairman. Not more than three members may be of the same political party. The board exercises the powers, mostly of a quasi-legislative and quasi-judicial nature, which have been conferred on it as a result of the Civil Aeronautics Act of 1938 as modified by Reorganization Plans 3 and 4. The board prescribes safety standards, rules, and regulations and has the power to suspend and revoke safety certificates after hearing; it issues, among other things, certificates of public convenience and necessity to air carriers and permits to foreign air carriers; regulates rates for the carriage of persons and property; prescribes rates of compensation for the carriage of mail. The board makes rules on notification and report of accidents involving aircraft; investigates such accidents and reports the facts, circumstances, and probable causes; makes its reports and recommendations public in such manner as it deems to be in the public interest.

CIVIL CORPORATIONS. See CORPORATIONS, LEGAL.

CIVIL DAMAGE ACTS, legislative acts passed in several of the states, giving to husbands, wives, children, parents, guardians, employers, and others who have sustained injury in person or property or means of support, by an intoxicated person in consequence of such intoxication, the right of action against the person who sold or gave away the liquor which caused such intoxication. Such acts have been held to be constitutional. In some cases the right of action has been extended to the owner of the premises where such intoxicating liquor has been obtained.

CIVIL DEATH, a legal term applied to a person who, on account of some crime, has been convicted and sentenced to life imprisonment, thereby losing all his civil rights, and is considered in law, dead. In some jurisdictions a person convicted of murder and sentenced to life imprisonment is considered in law as dead.

CIVIL DEFENSE, the protection of the home front by civilians acting under civil authority to minimize casualties and war damage and preserve maximum civilian support of the war effort. It rests upon the principle of self-protection by the individual, extended to include mutual self-protection on the part of groups and communities. Manned largely by unpaid part-time volunteers, each service of civil defense acts in cooperation with the others for the common good.

Preliminary Conceptions.—American civil defense activities during World War I did little more than bolster morale. During World War II, the Office of Civilian Defense (OCD) and civil defense agencies on the state and local levels were assigned duties and functions of the vaguest sort. With the policies and plans being channeled down through regional OCD offices, various protective activities emerged on the local level, but the War Department Civil Defense Board estimated in 1948 that the OCD effort would have been totally unable to cope with heavy enemy raids.

Prior to World War II, England organized a civil defense program which gave the people a plan for action. Japan did not believe that attacks would reach her shores and was ill-prepared in civil defense procedures and facilities. Germany had only a partial conception of the needs and was hampered by administrative muddles.

In Canada the problems of civil defense were very different from those in countries like England or Germany with dense populations, relatively small areas and much shorter distances from possible enemy bases. With its three and a half million square miles, Canada is one of the largest countries in the world and yet has less than 15 million people. It is some thousands of miles away from Europe or the Far East. Alaska, the only part of the continent close to Russia, is in the hands of the United States. Hence Canada is just as much interested in the defense of Alaska as is the United States in the defense of every part of Canada. Common interest dictates that they work together.

On March 27, 1951 the two countries effected a civil defense mutual aid agreement, and one month later held the first meeting of the Joint United States-Canadian Civil Defense Committee in Washington, D.C. Their discussions included such important matters as medical health, special weapons defense and emergency welfare, entry of civil defense forces and materials of one country into the other, training, standardization and interchange of equipment, communications and warning systems, state-province civil defense mutual aid agreements, and public affairs.

Present United States Civil Defense Organizations.—The Federal Defense Act of 1950 authorized a federal civil defense program for the United States. It was approved by the president on Jan. 12, 1951. A digest of the act follows:

The Federal Civil Defense Administration was created to formulate a plan to protect the people of the United States and their property from the effects of attack. The states and their political

subdivisions are responsible for civil defense, with the federal government providing guidance, coordination, and assistance.

The act establishes the Federal Civil Defense Administration as an independent agency within the executive branch of the government, and provides for the appointment of an administrator and a deputy administrator from civilian life.

It creates a Civil Defense Advisory Council of 12 representatives of federal, state, and local governments which shall meet at least once a year to advise the administrator on policy.

The administrator is authorized to develop plans and programs for civil defense; obtain reports from the states on the status of civil defense; coordinate the civil defense activities of federal departments and agencies; provide for the dissemination of attack warnings; make studies on methods dealing with effects of attacks; develop shelter designs and protective materials; standardize specifications for civil defense requirements; disseminate information through press, television, radio, and other means; assist and encourage the states to enter into mutual aid arrangements with each other and with neighboring countries; procure property and materials needed for civil defense, by purchase or condemnation; establish one staff college and not more than three technical training schools; prescribe the official civil defense insignia and some regulations covering its manufacture and use. The administrator also is authorized to make contributions to the states for approved civil defense projects. Such contributions may not be used for state or local personnel and administrative expenses, or procurement of land. Contributions for organization equipment or shelters must be matched equally by the different states.

On the declaration of a state of civil defense emergency by Congress or the president, the latter may direct federal agencies to provide their personnel, materials, and facilities to the administrator for the aid of the states. Under the coordination and direction of the administrator, such agencies will provide emergency shelters, facilities, and services, and make emergency repairs to essential facilities.

The administrator may also: procure, sell, lease, lend, transfer, or deliver property needed for civil defense; reimburse any state for compensation and other expenses paid to its civil defense workers serving beyond the borders of that state, and for materials utilized or consumed outside the state; give financial aid to civilians injured or in want because of an attack; and employ additional personnel without regard to civil service laws.

The act provides procedures for the payment of fair compensation for property acquired and for its return when no longer needed.

The title General Provisions provides the normal administrative authorities and in addition authorizes the administrator to utilize the facilities and resources of federal agencies and, with their consent, those of state and local governments; accept, use, or distribute gifts of supplies, equipment, and facilities; and authorize the states to organize individuals and organizations into units to be known collectively as the United States Civil Defense Corps, but members of the corps shall not by reason of such membership in the corps be regarded as federal employees.

The Reconstruction Finance Corporation is authorized to make loans, not to exceed \$250,000,000 at any one time, for projects certified by the

administration as necessary for the civil defense program.

Canada.—The present civil defense organization of Canada was established in 1948. Matters of major policy with regard to federal responsibility for civil defense are decided, subject to the control of Parliament, by the cabinet and the Cabinet Defence Committee. The minister of national health and welfare is responsible for planning and coordination and deals directly with provincial authorities. The cabinet and the minister are advised by the Chiefs of Staff Committee on questions of strategy as they bear upon the problems of civil defense. The chiefs of staff are responsible to the minister for directing participation of the armed forces in civil defense, where that becomes necessary.

The civil defense co-ordinator, responsible to the minister, is chairman of the Civil Defence Co-ordinating Committee and coordinates federal planning and action, while maintaining liaison with corresponding agencies in the United Kingdom, the United States and other countries. The Civil Defence Co-ordinating Committee has as permanent members representatives of the departments of Finance, National Health and Welfare, Public Works, Resources and Development, Trade and Commerce, Transport, Labor and Agriculture, as well as the Royal Canadian Mounted Police. The committee includes as well the secretary of the Chiefs of Staff Committee and the Dominion fire commissioner. Representatives of agencies such as the National Research Council and the Atomic Energy Control Board are called in when matters affecting them are discussed.

The Defence Research Board advises the minister, the armed services, and the civil defense co-ordinator on scientific developments in this and other countries applicable to civil defense.

Federal activities include organization within federal departments, the armed forces and other federal agencies; arrangements for coordination with provincial and local authorities; information to the provinces regarding general policy; co-operation and coordination with the United States and other countries; operation of a central training school for civil defense specialists; setting up of a warning system in cooperation with provincial and local authorities and agencies; protection of federal works against sabotage; research on civil defense, and providing equipment needed especially for civil defense over and above that required for ordinary peacetime purposes under terms and in accordance with arrangements worked out from time to time with the provinces.

Under the Canadian constitution a very considerable number of matters bearing on civil defense—fire fighting, police, administration of justice, municipalities, etc.—fall under the jurisdiction of the provinces, which have complete control of their own civil defense organizations. The following indications of possible lines of provincial activity may result from discussions between officials of the federal government and the provinces:

Provincial organization began with the appointment by every province of a minister or official with whom federal authorities might communicate regarding matters requiring provincial action.

According to the requirements of the province, the provincial authority might set up a committee with representation which might include other provincial departments concerned, such as Health,

Public Works, Provincial Police; the municipalities; public utility, transportation, and communication services; hospital and welfare service; and national and other organizations working within the provinces.

If desired, representatives of the armed services and the Royal Canadian Mounted Police may be detailed to work with the provincial authority for purposes of advice and liaison. The provincial authority deals with such matters as organization of municipalities for which civil defense is considered necessary; coordination of services of adjacent municipalities; provision of information to municipalities and other agencies operating within the provinces; training within the province; assistance to municipalities in meeting civil disaster; protection against sabotage of provincial services and advice on methods of protecting municipal and privately owned services; and insofar as lies within provincial authority, providing the necessary legislation to permit the local authorities to operate.

In each municipality in which the provincial authorities consider that there is a need for a civil defense organization, or where the municipality itself desires it, the local authority may initiate the necessary action. All available resources must be used to minimize the effects of a possible attack.

United Kingdom.—In Great Britain, under the Civil Defence Act, 1948, the postwar organization, formation, and training of civil defense forces were provided for. In March of that year the Civil Defence Joint Planning Staff was set up, and, by autumn, planning had reached the stage at which a practical program of civil defense could be put into effect. The year which elapsed between the passing of the act and the beginning of recruitment in November 1949 was largely spent in working out a system which would give the greatest possible control to the local authorities responsible for the following program:

Organization.—Volunteers are eligible for service in four units as follows:

Civil Defence Corps: organized in divisions, each responsible to a local authority, and subdivided into six sections: (1) Headquarters; communications; special reconnaissance; public information and administrative centers; identification of toxic agents. (2) Warden: supplementary air-raid warnings; incident control; movement of refugees; reconnaissance and reporting; organization of domestic self-help parties. (3) Rescue: rescue work; stretcher bearing; first aid. (4) Ambulance: ambulance driving and first aid. (5) Pioneer: debris clearance; demolition; decontamination of highways, vehicles, and clothing; cleaning of uninjured persons; stretcherbearing; salvage; emergency repairs to houses and utility services; road clearance. (6) Welfare: escort and welfare of homeless and evacuees; billeting; rest centers; supervision and welfare of public in shelters; emergency cooking and feeding; mobile kitchens and canteens; replacement of clothing; veterinary service.

Auxiliary Fire Service: organized in units of the regular force.

Special Constabulary: organized in the units of the regular force, special constables are asked to help the regular police in peace as well as in war.

National Hospital Service Reserve: limited to trained nurses and persons willing to train as nursing auxiliaries.

Training of Instructors.—Full-time instructors are trained in the latest defense methods at Home Office training schools, and thereafter conduct classes for volunteers in the evening and on week ends. The training of instructors includes courses on the effects of atomic explosions and the use of Geiger counters and pocket electroscopes to detect and measure harmful radiations. There are three Home Office training schools: at Falfield, Gloucester; at Easingwold, Yorkshire, and at Taymouth Castle, Perthshire, Scotland.

In addition to these schools, the Home Office maintains a Civil Defence Staff College at Sunningdale Park, Berkshire. The charter of the staff college provides for "training and study in all aspects of the higher direction of civil defence operations, including post-raid and restoration activities, for senior officers and officials of all services and organizations concerned in this part of the national defence system." The first of the four-week courses at the staff college enrolled 30 students, including civil defense heads and chiefs of police, from Britain, Malaya, and Gibraltar.

Royal Observer Corps.—Volunteers are also being recruited for the Royal Observer Corps. A training program for volunteers was inaugurated in 1950 which includes practice plotting, aircraft reconnaissance, and cooperation exercises with the Royal Air Force. Observers sign on for three years, and receive small annual grants with additional emoluments for traveling expenses and for passing efficiency tests. Volunteers must be between 16 and 55 years of age. The corps works on a post and center system covering five areas of the United Kingdom: Southern, Midland, Western, Northwestern, and Scottish.

Cooperation between the armed forces and the civil authorities in civil defense problems was studied in 1949, in two exercises of a consultation nature, and served to lay the foundations of civil and military liaison in civil defense problems.

Reorganized home defense in Britain by mid-1950 was only in a preliminary stage. More volunteers were needed, and the necessity for preparation and training during peacetime was stressed during the recruiting campaigns.

Detailed guidance also has been furnished to local authorities in leaflets and pamphlets.

Recruitment.—Recruits do not enroll for a fixed period of service, but are expected to continue in the Civil Defence Corps as long as they are able, and, in the event of war, will be given opportunities for full-time service. Recruits may transfer, where practicable, from one section to another but they are not compelled to serve away from home. No payment for service is made, but members are reimbursed for reasonable out-of-pocket expenses. Training in most sections averages four or five hours a month, for a total of 50 to 60 hours. Badges are issued to recruits who have completed their first ten hours of training.

T. P. HEADEN,
*Director, Publications Division, Public Affairs
Office, Federal Civil Defense Administration.*

CIVIL ENGINEERING. While the designation civil engineering dates back only two centuries, the profession of civil engineering is as old as civilized life. All through ancient times it formed part of a broader profession, best

described as that of the master builder, which included the branches now known as architecture and both civil and military engineering. Under the earliest Egyptian dynasty, 3000 to 3100 B.C., the title "chief of works" appears; and the master builder was busily engaged in carrying out those great constructions, pyramids, temples, and early irrigation developments still regarded as among the greatest works of man.

When Greece became the leading power in the eastern Mediterranean, new problems of urban life arose, notably public water supply and harbor constructions, while the temple constructions of Greece reflect a clearer understanding of the mechanics of construction as well as new standards of esthetic design. The interest of the Egyptians was in "how" rather than "why," but under the Greeks a truly scientific technique of design and construction began to develop. This evolution is reflected in the use of the title *architekton*, or architectonician, from which the present profession of architecture takes its name, but which at that time included all types of construction activities.

Similarly, the Roman *architectus* was engaged not only in the design and construction of public and other buildings but also in the many public works of the day, aqueducts, bridges, streets and highways, harbors, and drainage projects.

With the collapse of the Western Roman Empire, the public demand for such works no longer existed, and Western civilization struggled through the Dark and Middle Ages to a rebirth of civilized life which we carry forward today. It was inevitable that the modern world, born among the ruins of Roman civilization, should in the earlier stages base its constructions on Roman examples. In architecture this movement was reflected in the Romanesque style of the early Christian churches and monastic buildings. In engineering, the most notable examples are found in those bridges of the Middle Ages which have survived the ravages of floods and man. These works were clearly inspired by earlier Roman constructions.

While the engineering works of the Middle Ages were widely scattered in western Europe, for example the Old London Bridge (erected 1209 and replaced 1823), the Pont Valentre at Cahors (1355), and the Pont St. Benezet at Avignon, France (1187), it was in northern Italy that the revival in engineering as well as in art and literature first reached a new stage. It is probable that the modern canal lock was developed in Italy; a new form of masonry arch bridge, the segmental arch, was also an Italian product; and in the new era of military engineering Italian engineers were recognized as leaders. It was in the 16th century, following the French-Italian wars, that these developments were carried from Italy to France and became a basis on which French engineers established a leadership which was retained all through the 17th and 18th centuries. One of the most important and interesting of these developments was that of military engineering.

The Middle Ages had given birth to the feudal system, to control by independent petty nobles for whom the feudal castle, at once a home and a fortress, was developed. It is in connection with this field, the work of the military expert and builder who improved the ancient means of offense, the catapult, battering-ram, and similar devices of ancient times, and devised as a defense the medieval castle with its

moat, drawbridges, massive walls, and keep, that the terms engineer and engine first appear.

Tertullian, a father of the Latin Church, about 200 A.D., in writing earlier Roman history, described the Carthaginians as being dumfounded when the Romans attacked and brought up a battering-ram, a new and extraordinary *ingenium*. The Latin *ingenium* (wit) was thus first applied to a product of genius, an engine. After a lapse of almost a thousand years, the builder or manipulator of an *ingenium* became known as an *ingeniator*, or engineer.

This new title received wider recognition and application following the advent of gunpowder and the cannon in the 13th and 14th centuries. It has been characteristic of engineering that the rise of a new technique, unrelated to older practice, has given birth to new branches of this ancient profession. The new method of offense introduced new problems, such as the making of cannon, the factors involved in the trajectory of cannon balls, and also gave an impetus to military surveying which led to a host of texts on this subject—the first great flood of engineering books. This new weapon also rendered the medieval castle obsolete and led to the design of a new type of structure, the earthwork fortification. These new techniques, unrelated to the older activities of the master builder, brought about the separation of military activities as a specialty under the title of military engineering.

During the period usually referred to as the Renaissance, the situation was thus somewhat confusing, in that one man, such as Leonardo da Vinci (q.v.), might practice as an architect, as a military engineer, and also as a hydraulic expert. Of civil engineering, in the modern sense, however, there was little, for the master builder of the day, as in the Middle Ages, was precariously attached in a private capacity to one of the many military leaders or nobles. There was little or no demand for public works.

As such a demand gradually developed with the collapse of the feudal order and the rise of nationalism, the need for bridges, water supplies, canals, and other works was met not only by the architects or military engineers of the day but through the activities and skill of ingenious men drawn from other walks of life, such as Sir Hugh Myddelton (1557?–1631, q.v.) in England, the goldsmith who built the New River water supply for London in 1609, or Pierre Paul Riquet (1604–1680), in France, the tax collector and builder of the Canal du Midi (1680). It was John Smeaton (1724–1792, q.v.), of Eddystone Lighthouse fame, who, about 1750, first used the term civil engineer to distinguish his field from that of the military worker. On the other hand, the great French engineers, who were the engineering leaders of the 18th century, still retained a close liaison with the architects, and were members not only of the Corps des Ponts et Chaussées but also of the Institute of Architects.

With the development of steam power in Great Britain during the late 18th century and the chaos in Europe following the Napoleonic wars, engineering leadership passed to Britain, the home of the steam engine, the steam locomotive and railroad, of the modern era of iron and, later, steel, and of the first widespread application of this new power in industry. Here again a new technique was introduced which ultimately led to the birth of another engineering branch, mechanical engineering. Civil engineers, usually with mill-

wright training as a background, carried on this profession until it was clearly recognized as a separate field through the establishment of the Institution of Mechanical Engineers in Great Britain in 1847.

These developments in engineering were also influential in bringing about the separation of the work of the construction expert into the two professions now known as architecture and civil engineering. The architect, on the one hand, emphasized the esthetic element in design and confined his activities to buildings and monuments, those works in which this element dominated. The engineer, on the other hand, began to develop a more highly rationalized, scientific technique of design which, progressively, relied less and less on tradition, intuition, and appearance, the factors which controlled the work of the architect.

This movement to reduce engineering to a science stemmed from the French Revolution, but was first carried forward in its practical applications in Great Britain. The works of the Scottish engineer and physicist, William John Macquorn Rankine (1820-1872, q.v.), notably his *Manual of Applied Mechanics* (1858), *Manual of Civil Engineering* (1861), and *Manual of the Steam Engine* (1859), summarized these advances and were a milestone in this development. With this change, the divorce between engineering and architecture not only became complete but a new engineering era was born.

Needless to say, various methods of design and calculation had been developed in engineering from time to time, but the modern evolution of structural mechanics, and later of machine design and of practical thermodynamics, led to the more accurate proportioning of structures and machines in accordance with their proposed functions and the loads they had to bear. The effects of this change in technique were widespread. It led to a more effective and more economical utilization of materials. A new impetus was given to the ancient urge to secure the most effective and efficient design, still the fundamental factor in the constant advance in technical methods and design. Such exact and complete understanding was also essential to the growth in size and scope of engineering undertakings of modern times. But the reduction of many of the procedures of engineering to well-rationalized routines also made possible an age of widespread engineering development. The older practice, relying almost entirely on an intuitive engineering sense developed and matured through experience, was limited to those few and rare individuals who possessed such personal gifts. The new techniques could not only be taught to many who were not so fortunately gifted, but could also be more effectively imparted through the formal processes of the classroom than through the older method of apprenticeship. This change is strikingly reflected in the growth of American engineering schools. Before 1850 there were only three such schools in the United States, whereas, by 1870, there were 70. (In 1945 the total number of accredited schools was about 125.)

The new era did not come into being without protests from the so-called practical man, but the formal education of the engineer has now become so well recognized that graduation from an accredited school is practically essential to securing the necessary license (now required by almost all the states) for practice as a professional

engineer. Furthermore, the modern engineering school, born of the scientific movement in engineering and often called a scientific school, still occupies a position of leadership in the continued search for improved products, processes and methods, and for the further rationalization in design, through research and graduate instruction.

Modern Trends and Relationships.—The position of the engineer in the life of his day has varied greatly throughout the long history of the profession. In ancient Egypt the master builder became one of the highest nobles of the royal court, planning and actively directing a host of subordinate officials in the construction of the royal tombs and great temples, as well as being responsible for the economy of the country, the surplus of which made possible the great but useless royal works of this long era. It is notable, however, that Egyptian economics and political life became firmly established in fixed forms in the earliest days of the pyramid age and that there were no important developments in technical methods or design after that period; in fact, the quality of Egyptian construction steadily deteriorated. While Egypt had the organized authority essential to great public constructions, and a large population to be served by such works, this economy was exploited in the interests of the rulers and priesthood, and an incentive to continued technological development was lacking.

In Greece, on the other hand, while scientific inquiry was encouraged, the emphasis was placed on art, literature, and philosophy rather than on useful applications, and the Greek city-states were never able to secure that degree of political unity essential to widespread engineering development. The notable contributions of Greece to technical development must not be minimized, for Greek technology was basic to all the work of Roman and later master builders. But the economic and political atmosphere of Greece was unfavorable to engineering progress, and, accordingly, retarded a most promising technical growth and development.

The Greek *architecton* appears to have occupied a relatively unimportant position in the life of his day unless he happened to be connected with the building of public temples or other works of art. Under Roman rule, on the contrary, the work of the master builder was considered of primary importance. While the Romans contributed road building, the development of the masonry *vousoir* arch, and a widespread use of cement, they lacked the inquiring mind which we regard as typical of the Greeks. Very little new technical knowledge was added by Rome to the accumulations of earlier centuries. Yet Roman civilization spread throughout the ancient world and wherever Roman armies went, sooner or later Roman constructions followed—Roman roads and aqueducts were built from Spain to Asia Minor, from North Africa to Britain. The real promoters and planners of these works were the leading public officials of the day, while the details were left to numerous petty officers and technicians. The modern engineer thus finds in Roman rule a remarkably fertile field for the study of widespread engineering developments, but notes a lack of that spirit of scientific and technical inquiry which is essential to a continued engineering growth and evolution.

The Dark and Middle Ages afforded no such opportunities for engineering progress. The mas-

ter builder, architect, military engineer, or bridge builder, was primarily a master craftsman in the service of one of the many petty leaders of the day.

An important date in the rebirth of the engineering profession is that of the first organization of a corps of engineers in the French Army under the Marquis de Vauban in 1672. Parallel to this first modern recognition of the profession, the various finance ministers of France aided and encouraged the industrial and economic development of their country not, unfortunately, in the public interest but, primarily, with the desire to increase the royal income through taxation. Again the economic and political scene was unfavorable to a full fruition of the remarkable contributions which French engineers, usually members of the corps, made to technological progress.

During the rise of British leadership in the late 18th century, the engineer was still employed primarily on a personal, private consulting basis, but he worked under a democratic, rapidly expanding economy and with the further incentive to technical development provided by the new source of power, steam, and the new material of construction, iron. These conditions were continued on an even greater scale and with the unparalleled natural resources of a new continent when in the 19th century the United States became the most active engineering nation in the world. With the transformation of engineering into a science, the major factors which create a widespread engineering development were simultaneously present for the first time in the history of the world. Large populations under democratic rule in an expanding economy led to an unprecedented demand; and new materials, products, and techniques, the results of continuous work in scientific and technical research, give constantly increasing power to the engineer in meeting this demand.

Modern Practice in the United States.—The field of civil engineering, once defined as including all branches of engineering other than military, has come to include primarily the professional aspects of construction, a field which it shares in part with architecture. The civil engineer is engaged in the planning and design of works connected with transportation by railroad, highway, waterway or air, including railroad, highway and street location, bridges and other incidental structures, canals, rivers, piers and harbors, terminals and airports. The hydraulic field covers water supply for public or private use, water power, flood control, drainage and irrigation, as well as sewerage, and sewage and waste disposal. Various combinations of these activities are referred to as railroad, highway, structural, hydraulic, sanitary or municipal engineering. The civil engineer may also specialize in various steps in the stages of a project, such as investigation, design, construction, operation, or valuation. Modern construction has, in fact, become highly specialized, requiring skill in the planning and designing of plants, scheduling and direction of labor, and the development of construction methods and procedures.

While the civil engineer is thus principally concerned with capital investments in more or less permanent plants and works, he must also be able to select and utilize effectively the products provided by the other branches of the profession which are concerned primarily with

consumer goods, such as the materials of construction and industry (mining, metallurgical and chemical engineering), including steel, timber, concrete, and many other materials; the modern applications and use of steam, electric and gas power engines and machinery (electrical and mechanical engineering); and with the principles of production methods and techniques (industrial engineering). The education of the civil engineer therefore necessarily includes the fundamentals of all these other branches of engineering insofar as they enter into the planning, design or construction of civil works.

During the 19th century in the United States, the transportation problem, notably the railroad, dominated the engineering field, and the majority of civil engineers were employed in railroad work. Later in the century, urban problems became pressing. Many water supply works were carried out by private companies, but, as sanitation increased in importance, they were planned and designed as public works by private consulting experts. At the present time, the ordinary maintenance of municipal works is provided by public agencies, while consulting engineering firms are called upon for designs requiring special competence and experience.

River and harbor undertakings have long been important peacetime activities of the Corps of Engineers of the United States Army. In 1902 the United States Bureau of Reclamation began its extensive series of works, including such notable hydraulic constructions as Boulder, Grand Coulee, and other dams. At the turn of the century the Panama Canal was undertaken as a federal project, and the modern highway era was also initiated and developed on a state basis with federal aid and support.

While there has been increasing employment of civil engineers in public service, ever-increasing specialization still encourages the maintenance of private consulting offices. The tremendous demands for engineering services since World War II have likewise supported many private consulting firms. Engineering construction, almost invariably undertaken by private companies, has become, as noted, largely a specialized branch of the profession. Thus while many positions are available for civil engineering employment in public offices, the field still offers interesting opportunities for private initiative in railroad, industrial, and other activities, notably in specialized design and consulting services and in construction.

Education.—The earliest school for civil engineers was the École des Ponts et Chaussées, established in 1747 to train men to serve in the corps of the same name which was responsible for the building of the roads and highways of France. The first American school was at the United States Military Academy, West Point, which was organized in 1802 and remained entirely a school for army engineers until 1866. Norwich, Vt., 1819, and Rensselaer Polytechnic Institute, at Troy, N. Y., 1824, followed and, after 1860, a large number of schools was organized.

In general, a four-year course in civil engineering, based on high school graduation and leading, usually, to a B.S. or B.C.E., is standard. It has been recognized, however, that, with the constantly increasing requirements for more advanced scientific and technical instruction, plus a reasonable allowance of time for general educa-

tion, four years is inadequate. A few schools have turned to five-year courses, while many schools offer graduate specialization following the bachelor's degree.

The young man looking forward to civil engineering as a career must, therefore, plan to complete at least four years of collegiate study. Thereafter he will serve a period of apprenticeship in an engineering office or in the field, and, having proved his ability, obtained adequate experience, and been in responsible charge of important work, may then, after a minimum of usually four years following graduation, apply for examination for a professional license.

As in all professions based on science, the educational requirements have been constantly rising in civil engineering. Even in the positions of subordinate technical aides, such as surveyor, draftsman, detailer, or assistant designer, inspector, timekeeper, or assistant on construction, constantly higher degrees of technical competence and skill are essential. In particular, mathematical techniques and procedures are becoming more highly developed and involved, while, in almost all phases of practice, an ability to work with and direct others is essential. The newer fields of activity include such branches as airplane structural design, and similar specialties, based on the most advanced methods and techniques of applied mechanics, stress analysis and design, normally covered only in graduate courses.

Professional Societies.—The oldest professional group in the English-speaking world is the Institution of Civil Engineers of Great Britain, founded in 1818, with the famous Scottish engineer, Thomas Telford (1757–1834, q.v.) as its first president. In the United States, the Boston Society of Civil Engineers, organized in 1848, and the American Society of Civil Engineers (q.v.), founded in 1852, are the oldest engineering organizations. These organizations are predated, however, by the Corps des Ponts et Chaussées in France and by the Smeatonian Society, a small group centering about John Smeaton, in England. The various civil engineering specialties have also led to the formation of numerous special societies such as the American Society for Testing Materials (ASTM), which has been a leading influence in the development of standards and specifications for engineering materials; the American Railroad Engineering Association (AREA), the American Highway Association, the American Water Works Association, the American Concrete Institute, and various other organizations.

Dean Emeritus, School of Civil Engineering,
Columbia University.

CIVIL LAW. The term "civil" is derived from the Latin *civilis*, which means concerning or pertaining to a community, a city, or a state (*civitas*), or its citizens (*cives*). The expression

"civil law" has its predecessor in the *ius civile* of the Roman law in which it acquired various meanings in the course of time; none of them, however, covers what in modern English juristic terminology is called civil law. In the Roman world *ius civile*, in its earliest significance, was the legal order, the legal rules and institutions, the national law of the Romans (*ius proprium civitatis*) as first established in the law of the Twelve Tables (q.v.) of 451–450 B.C. and later developed through interpretations (*interpretatio*) by Roman jurists (men learned in the law) and juriconsults (after Augustus, persons licensed by the emperor to give legal opinions), and through specific laws (*leges* = statutes) issued in a constitutional way by the Roman people gathered in popular assemblies (*comitia*). To these sources of *ius civile* in its narrowest sense a classical jurist, Papinianus, added the decrees of the Senate (*senatusconsulta*) and even the enactments of the emperors. The earliest *ius civile* is also named *ius Quiritium* (Quiritarian law).

To the *ius civile* thus conceived as the national law proper of the Roman people the *ius honorarium*—the law created by the highest magistrates (predominantly the praetor), who were authorized to set new legal principles in their edicts—is opposed. In another sense, the *ius civile* appears as contrasted to the so-called *ius gentium*; while the latter denotes the legal norms which originating from commercial relations between Romans and foreigners later applied to relations among Roman citizens themselves, the former refers to Roman citizens and embraces legal institutions inaccessible to foreigners. Another contrast is *ius civile* versus *ius naturae* (*naturale*), the latter being the law which "natural reason" (*naturalis ratio*) created for all human beings, as opposed to the "civil" law arising from all kinds of legal sources.

Finally, the term *ius civile* occurs in the title of a few juristic treatises (*libri iuris civilis*), written in the late Republic and the early Principate (the most important by the jurists Quintus Mucius Scaevola and Massurius Sabinus), in which the presentation is not strictly confined to the *ius civile* in its narrow early conception; through occasional inclusion of some rules of the *ius honorarium* the term *ius civile* was here brought nearer to the general meaning of private law (*ius privatum*) regulating the relations of citizens to each other. It may be stressed, however, that in Roman sources *ius civile* does not appear as opposed to criminal law, as it is in modern juristic terminology, nor had it the meaning of the law of civilians as contrasted to the law concerning soldiers (military law).

In the late 16th century *ius civile* acquired quite a new connotation. The creation of an official collection of ecclesiastical laws, *Corpus Iuris Canonici* (the body of canon law) might have suggested the name *Corpus Iuris Civilis* (the body of secular [civil] law) which was given to Justinian's legislative work as a whole (the Institutes, the Digest or the Pandects, the Code, and the Novels). The title, which never had been used by the emperor himself, appeared for the first time in 1583 in the edition of Justinian's work by the French Romanist, Denis Godefroy (Dionysius Gothofredus). Here the word *civilis* was applied to the whole Roman law without regard to what the term meant in earlier times and in the codification itself. It comprised both private and public law, procedural, and penal

law, administrative and military law. From this denomination arose the modern English use of the term civil law.

Starting from the identification of the Roman law as embodied in Justinian's codification with *ius civile*, the term is currently applied to something quite different, namely, to legal systems in other countries in which Roman law was either accepted ("received," hence the term "reception" of Roman law) at any one time to be the law of the receiving country, or in which their codifications had been based on fundamental Romanistic principles and categories. This use of the term civil law is specific in the English language and Anglo-American legal terminology and has no counterpart in the juristic language of the countries whose law, in particular the private law, has its roots in Roman law. In French *droit civil* is identical with *droit privé*, without regard to its origin, Roman or other; in Italian *diritto civile* is synonymous with *diritto privato*; and a similar identity of these terms exists in some of the Slavic languages. German terminology applies both the term *Zivilrecht* and *Bürgerliches Recht*; in the latter expression *bürgerlich* is the exact translation of *civilis* (*Bürger* = *civis*). Hence the German code of private law is called *Bürgerliches Gesetzbuch* (BGB), while the official German title of the later Swiss Code is *Zivilgesetzbuch*. In all these non-English applications the word *civil* is used in contradistinction to criminal law on the one hand, and to commercial law on the other.

A similar inconsistency as existed in the Roman terminology occurs in English too. Thus civil law is frequently identified with private law in English juristic literature, to mention only the well-known two-volume textbook, Jenks' *English Civil Law*, 4th ed. (London 1947). The same was done by the Roman jurists, Mucius Scaevola and Sabinus, mentioned above. On the other hand, in English-speaking lands civil law more often is simply identified with Roman law, and university professors appointed for civil law teach Roman law proper. When seeking traces of Roman law in the English law, scholars often speak of civil law, and the identification of Romanist scholars as "civilians," which hardly can be considered fortunate, is not rare in literature.

Most European countries belong to the realm of civil law in its Anglo-American conception, except Soviet Russia and, nowadays, some of her satellites, insofar as they have recently modified their private legal systems after having lived for long periods under Romanizing codifications.

Central, Western, and South Europe are in general under the civil law regime. Those European countries whose civil codes served afterward for other countries' codifications are the typical representatives of the so-called civil law system, including such national codes as the French Civil Code (*Code Civil* or *Code Napoléon*, 1804); the Austrian Code (1811, *Allgemeines Bürgerliches Gesetzbuch* = the General Civil Code); the Spanish Code (1886); the German *Bürgerliches Gesetzbuch* (published 1896, in force since 1900); the Swiss Civil Code (1907, in force since 1912) on which the Turkish civil legislation (1927) is based. The latest European codification in this group is that of Greece (1940, in force since 1946). Among other European countries Scotland deserves particular mention.

Many non-European lands have systems which are likewise based on the civil law. Thus, in Asia: China (1911), Japan (whose civil code is based on the German code), Ceylon, the Philippines, Thailand (1925), Lebanon (1933), and others; in Africa: Tunisia, Morocco, Algeria, Union of South Africa (its law is called Dutch-Roman law because of the influence of Netherlands jurists on its development); in America: all the South and Central American countries, Mexico, Cuba, Haiti, Dominican Republic, and Puerto Rico, the Province of Quebec in Canada and, in the United States, the State of Louisiana (with a code which adopted the French *Code Civil* with addition of Spanish elements).

In the so-called civil law countries (more than one third of the world) differing economic, social, cultural, political and historical backgrounds have conduced to a great variety of modern legal systems through progressive legislative enactments. Consequently it is inappropriate to designate all these variant systems by such an all-embracing term as "modern Roman law"; although that loose term continues in current use, it is objectionable as misleading.
